## JHP760

High performance – ISO-M – Square – 2-4 Flutes – Cylindrical – Corner radius

- Tolerances:
- DMM=h5
- DC= -0,02/-0,04 mm
- RE= ±0,03 mm
- Regrind possible if DC is ≥ Ø6

## NON FERROUS

Seco offers a complete range of high performance solid carbide square shoulder end mills, ballnose cutters and finish end mills for high productivity for non ferrous materials.

- JS412 and JS413 for sharp corner type.
- JS452, JS453, S4521, S4531 and S4651 with 45° chamfer type.
- JS452, JS453, S4521, S4531, S4651, HP4931, S4931, JH40, HP4931, S4931 JH421, JM403, JM404, JM406, JH410 and JH440 for radius type.
- S4321, JH450, JH460, SMB413, SMB414, SMB416, JM413 and JM416 for ball-nose type.

## JH410

High performance – Aluminium – Square – 1 Flute – Cylindrical – Corner radius

- Tolerances:
- DMM= h5
- DC= -0,02/-0,04 mm
- RE= ±0,02 mm
- Regrind possible if DC is ≥ Ø6

## HARD

Seco offers a complete range of high performance solid carbide square shoulder end mills, ballnose cutters and finish end mills for high productivity for hardened steel.

- JHP170, JHF181, JH120, JH130, JH930, JH142, JME142 and JME144 for radius type.
- JH112, JH150, JH160 and JMB112 for ball-nose type.

## JH120

High speed – Hardened steel – Square – 4 Flutes – Cylindrical – Corner radius

- Tolerances:
- DMM=h5
- DC= -0,02/-0,03 mm
- RE= ±0,01 mm
- Regrind possible if DC is ≥ Ø6

## JH112

High speed – High precision – Hardened steel – Ball nose – 2 Flutes – Cylindrical

J

- Tolerances:
- Run-out = <0,005 mm
- DMM = h5
- DC = <Ø0,6 = 0/-0,008 mm
- DC = ≥Ø0,6 = 0/-0,01 mm
- RE = <Ø0,5 = ±0,004 mm
- RE = ≥Ø1,5 = ±0,005 mm
- Regrind possible if DC is ≥Ø6

## PLASTIC AND CFRP

Seco presents a complete solid carbide end mill product range for the machining of glass and carbon fiber reinforced plastics. It consists of diamond-coated and uncoated solid carbide and PCD end mills incorporating different geometries as well as with PCD-brazed cutting edges. This is a product range offering optimized tools for difficult cutting conditions on challenging workpiece materials.

- JC860, JC870, JC871, JC899, JPD890, J93F and J28 for sharp corner type.
- JC845, JC880, JC885 and JC898 for radius type.
- D8961, JC875, JC876, JC877 and JPD880 with 45° chamfer type.
- JC850 and JPD850 for ball-nose type.

#### Tool Selection Plastic and CFRP

## GRAPHITE

Seco diamond-coated solid carbide end mills are designed specifically for machining graphite. They offer up to 10 times more tool life than milling cutters with conventional coatings. Available in a variety of geometries and an extensive diameter range, these tools feature the best possible substrate to ensure the perfect adhesion of the diamond coating across a range of cutting parameters.

- JD620, JD630, JD640 and JME642 for radius type.
- JD660, SMB614, SMB616 and JMB642 for ball-nose type.

## SECO X-HEADS

The new Seco Tools Exchangeable Head range is a comprehensive offering to meet most customer demands. Utilizing our proven solid carbide geometries, we offer various types to machine most materials and complete various machining operations. The connection is a proven exchangeable head design to give high process security and reliability. The shanks offer many types for short reach up to long reach applications. Straight necking and tapered necks to give the best combination of stability depending on the needs for your machining operation.

- XSE550, XSE720, XSE450, XHF580, XHF780 XVE540 and XVE510 for chamfer or radius type.
- XSB540, XSB720 and XVB510 for ball-nose type.
- XVC506, XVC509, XS5021, XS5061 and XVC512 for conical type.
- XHT740 for barrel type.

## XSB540

High performance – Universal – Ball nose – 4 Flutes

D

- Tolerances:
- DC= e8
- RE=  $\pm 0,02$  mm
- Regrind possible if DC is  $\geq \varnothing 12$  mm

\*Max ramping angle

All values are percentages of original (100%) cutting data.

## Nomenclature and formulae

|                                            |                        |
|--------------------------------------------|------------------------|
| <b>RPM</b>                                 |                        |
| $n = \frac{v_c \cdot 1000}{\pi \cdot D_c}$ | (rev/min)              |
| <b>Cutting speed</b>                       |                        |
| $v_c = \frac{n \cdot \pi \cdot D_c}{1000}$ | (m/min)                |
| <b>Feed speed</b>                          |                        |
| $v_f = n \cdot z_n \cdot f_z$              | (mm/min)               |
| <b>Feed per revolution</b>                 |                        |
| $f = z_n \cdot f_z$                        | (mm/rev)               |
| <b>Metal removal rate</b>                  |                        |
| $Q = \frac{a_e \cdot a_p \cdot v_f}{1000}$ | (cm <sup>3</sup> /min) |
| <b>Cutting speed and RPM for copying</b>   |                        |
| $v_c = \frac{n \cdot \pi \cdot D_w}{1000}$ | (m/min)                |
| $n = \frac{v_c \cdot 1000}{\pi \cdot D_w}$ | (RPM)                  |
| $D_w = 2 \cdot \sqrt{a_p (D_c - a_p)}$     | (mm)                   |

### Calculation of $a_p$ vs. overhang length:

If the overhang length (XS) is longer than 4 x DC and Cylindrical shanks are used it is important to adopt another depth of cut ( $a_p$ ) value than that indicated in the table.

Use the following formula to calculate the new  $a_p$  value

$$a_{p\text{new}} = a_p \times (4 \times DC/XS)^2$$

### Profile height

$$H = \frac{D_c}{2} - \sqrt{\frac{D_c^2 - a_e^2}{2}}$$

$$D_w = 2 \cdot \sqrt{a_p (D_c - a_p)} \quad (\text{mm})$$

### Profile height H (um)

| DC | Pitch $a_e$ (μm) |      |      |      |      |      |      |
|----|------------------|------|------|------|------|------|------|
|    | 0,06             | 0,08 | 0,11 | 0,15 | 0,20 | 0,3  | 0,45 |
| 1  | 0,90             | 1,60 | 3,00 | 5,70 | 10,0 | 23,0 | 53,0 |
| 2  | 0,45             | 0,80 | 1,50 | 2,80 | 5,0  | 11,0 | 26,0 |
| 4  | 0,23             | 0,40 | 0,76 | 1,40 | 2,5  | 5,60 | 13,0 |
| 6  | 0,15             | 0,27 | 0,50 | 0,94 | 1,7  | 3,80 | 8,40 |
| 8  | 0,11             | 0,20 | 0,38 | 0,70 | 1,3  | 2,80 | 6,30 |
| 10 | 0,09             | 0,16 | 0,30 | 0,56 | 1,0  | 2,30 | 5,10 |
| 12 | 0,08             | 0,13 | 0,25 | 0,47 | 0,83 | 1,90 | 4,20 |

$a_p$  = Depth of cut mm/axial depth of cut (mm)  
 $a_e$  = Width of cut mm/radial depth of cut (mm)  
DC = Cutter diameter  
 $f$  = Feed per revolution (mm/rev)  
 $f_z$  = Feed per tooth (mm/tooth)  
 $z_n$  = No. of teeth  
 $n$  = RPM (rev/min)  
 $Q$  = Material removal rate (cm<sup>3</sup>/min)  
 $v_c$  = Cutting speed (m/min)  
 $v_f$  = Feed speed (mm/min)  
 $D_w$  = Working diameter

## Operation recommendations

### Helical interpolation ramping

The table below shows the diameter recommendations for Helical interpolation ramping

#### Recommended diameter of hole for helical interpolation ramping

| Diameter of end mill DC | Diameter of hole |
|-------------------------|------------------|
| 1-2,5                   | 1,4 x DC         |
| 3-6                     | 1,3 x DC         |
| 8-12                    | 1,2 x DC         |
| 16-32                   | 1,15 x DC        |

### Trochoidal method

The figure below shows a method often called the trochoidal method for milling slots

#### Recommendation of width of slot

| Diameter of end mill DC | Slot width |
|-------------------------|------------|
| 1-2,5                   | 1,8 x DC   |
| 3-6                     | 1,6 x DC   |
| 8-12                    | 1,4 x DC   |
| 16-32                   | 1,2 x DC   |

## MINIMASTER™

Minimaster™ is a unique, versatile end milling system that can combine different solutions for optimum accessibility and maximum stability and security.

The flexible two-piece design combines shanks and inserts to save time, money and create a versatile tool that enables users to find a solution for almost every application – whether they need to minimize the overhang, attain maximum stability, or more.

- Square Shoulder range: 6-20 mm (.25 - .75 inch)
- Ballnose range: 6-20 mm (.25 - .75 inch)
- Center Drilling/Chamfering range: 6-19,05mm (.25 - .750 inch)
- High Feed range: 8-12 mm (.375 - .625 inch)
- Plunging range: 6-16 mm (.25 - .625 inch)
- Concave Radius range: 12 mm (.472 inch)

## Selection guide

### 1. Select taper size

The design of the workpiece and the machining operations determines suitable taper size. Select the largest possible taper size for best strength and stability.

### 2. Select insert

- Use the tables beginning on page 802 to classify the workpiece material into a Seco material group.
- Look up the pages for the selected taper size and choose a suitable insert in the insert selection table.

### 3. Select shank

- Look up the pages for the selected taper size and choose a suitable shank in the tool data table.
- Always choose the shortest shank possible to achieve the best possible stability.

### 4. Select cutting data

- Cutting speed recommendations are found in the cutting data tables for each selected taper size. Cutting data recommendations are based on stable conditions and might therefore need to be adjusted depending on the stability in the application (tooling, machine & workpiece fixturing). General rule for max ap in slotting is  $DC \cdot 0.3 = \text{Max APMXS}$ . (See figure 1)
- Feed and cutting speed recommendations are found in the cutting data conversion table.
- Maximum RPM that for safety reasons should never be exceeded, are shown on page N/A.
- If the cutter is not fully engaged the feed per tooth and the cutting speed should be increased compared to the recommendations for a fully engaged cutter. The reason for that is to keep the average chip thickness and the working temperature in the cutting zone.
- Divide the radial depth of cut with the cutter diameter to get the actual cutter engagement percentage ( $a_e/DC\%$ ), for ball nose cutters use the effective working diameter  $D_w$  instead of DC (See figure 2 & 6)
- Use the percentage to get a correct feed per tooth and cutting speed recommendation for the actual cutter engagement.

### 5. General

- When milling in corners and bottoms of cavities the feed rate should be reduced due to the increase of the average chip thickness. Use the feed per tooth recommendations for a fully engaged cutter.
- When steep down copying with an angle bigger than  $40^\circ$  or steep up copying with an angle bigger than  $30^\circ$  in combination with small depths of cut, use the diameter (DC) as working diameter instead of  $D_w$ .
- When calculating feed per revolution and feed speed, always use the ZEFP-value. That is the effective number of teeth to use for cutting data calculations. The ZEFP-value can be found in the insert selection table.

**Note!** There will be a deterioration in the surface finish on the workpiece when the feed rate is increased. (See figure 3 & 5)

### Torque wrench and Max RPM information

#### Torque wrench

Recommended RPM for all Seco cutters are shown on each catalogue page.  
Normally there is no need for balancing tools for RPM up to 10 000.  
However in some cases balancing is necessary, for instance when using heavy tools and tool holders in small machines

Torque wrench with fixed torque values to ensure the correct tightening force when mounting the Minimaster insert into its holder.  
Dynamomentic keys are calibrated according to ISO 6789.

Code key: MM02-4006

MM02 = 2-flute (MM03 = 3-flute)

40 = Torque value 4 Nm

06 = Insert size

Over 10 000 RPM:

We recommend balancing of tool and tool holders at least separately.

Over 20 000 RPM:

Both tool and tool holders must be balanced at least separately.

Over 30 000 RPM:

Tool and tool holders must be balanced as a unit.

The max RPM in the tables should never be exceeded.)

#### 2 flute inserts

| Insert size      | Torque wrench (including key end)                                                  | Replaceable key end                                                                | Torque value |

## SMG – Introduction

The foundation for SMG is a classification of workpiece materials based on their type rather than their relative machinability and consequently it contains workpiece materials like composites. It is comprehensive enough, but still easy to identify which SMG a particular material belongs.

Each SMG has a specific material standard in a specific condition assigned as reference to allow easy adjustment of cutting data for any actual material compared to any Seco reference material see page(s) 802-805.

As example the reference materials EN C45E for SMG P4 and EN 42 CrMo 4 for both SMG P5 and SMG H5 see further details in the following tables.

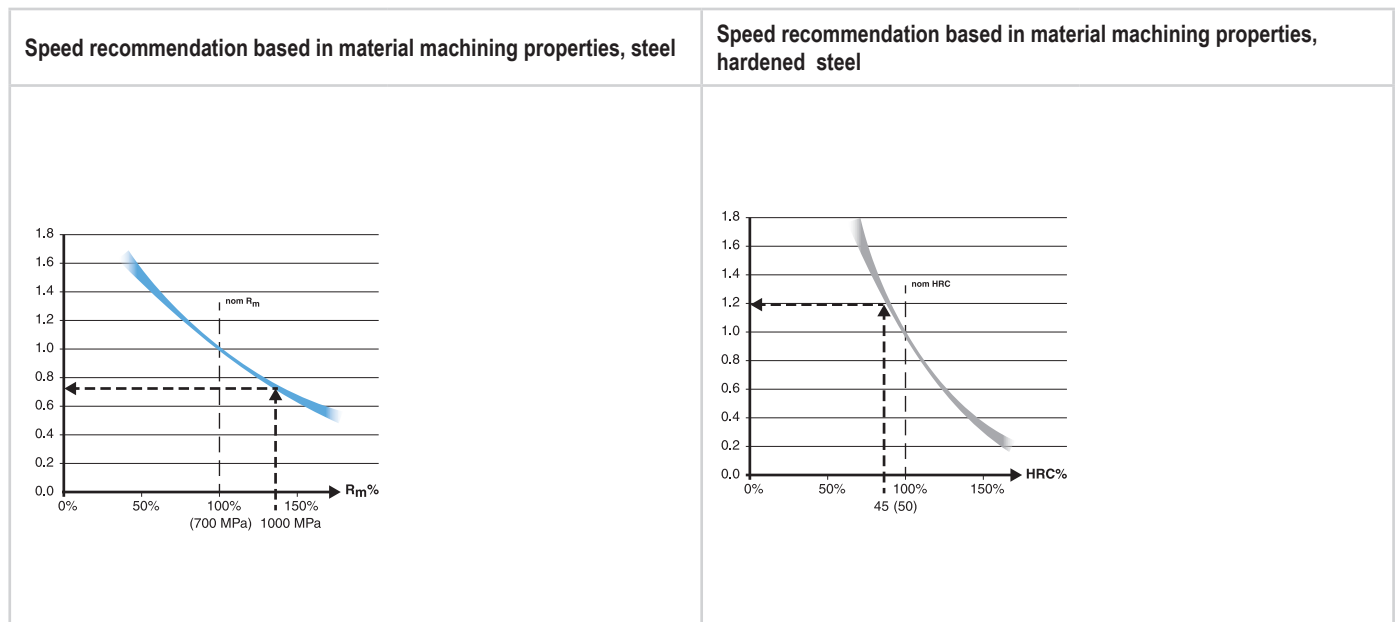

|    |                                                                                              |                             |                                                     |    |                            |               |                     |
|----|----------------------------------------------------------------------------------------------|-----------------------------|-----------------------------------------------------|----|----------------------------|---------------|---------------------|
| P4 | Low-alloy general structural steels, 0.25% < C < 0.67%wt<br>Low-alloy Quench & Temper steels | 520 < R <sub>m</sub> < 1200 | C 45E<br>R <sub>m</sub> = 660 N/mm <sup>2</sup>     | H5 | Quenched & Tempered steels | 38 < HRC < 56 | 42 CrMo 4<br>50 HRC |
| P5 | Structural steels, 0.25% < C < 0.67%wt<br>Quench & Temper steels                             | 550 < R <sub>m</sub> < 1200 | 42 CrMo 4<br>R <sub>m</sub> = 700 N/mm <sup>2</sup> |    |                            |               |                     |

Focusing specifically on EN 42 CrMo 4 in annealed condition, the ultimate tensile strength R<sub>m</sub> may typically vary between R<sub>m</sub> = 630 N/mm<sup>2</sup> and R<sub>m</sub> = 780 N/mm<sup>2</sup>, which provide a reference level for SMG P5. In Quenched & Tempered condition, the ultimate tensile strength R<sub>m</sub> may typically be between R<sub>m</sub> = 900 N/mm<sup>2</sup> and R<sub>m</sub> = 1100 N/mm<sup>2</sup> thus still belongs to SMG P5. However, if hardened above R<sub>m</sub> = 1200 N/mm<sup>2</sup> it instead belongs to SMG H5.

|    | 42 CrMo 4 | 1.1201 | 42 CD 4 | 708 M 40 | 42 CrMo 4 | SCM 440 (H) | 4142, 4140 | 38HM | Quenched & Tempered |      | 50 |

The EN 42CrMo4 quench & tempered steel could be used to illustrate the machinability dependence of materials' condition.

The graphs below indicate how speed recommendations for a nominal material conditions may be adjusted for relative R<sub>m</sub> (left diagram valid for ISO-P) and for relative HRC (valid for ISO-H).

To further illustrate how the SMG P5 nominal v<sub>c</sub> can be adjusted to a more accurate recommended v<sub>c</sub> we need ultimate tensile strength R<sub>m</sub> data and in this case we use the EN 42 CrMo 4 quenched & tempered to R<sub>m</sub> = 1000 N/mm<sup>2</sup> according to above table (bold blue arrows).

Assume that we find that the SMG P5 nominal v<sub>c</sub> = 280 m/min / 918.64 sfm for a certain product and machining.

Then, actual recommended v<sub>c</sub> = 280 m/min x 0.75 = 210 m/min / v<sub>c</sub> = 918.64 sfm x 0.75 = 688.98 sfm.

Consequently in the SMG H5 the nominal v<sub>c</sub> can be adjusted using the hardened EN 42 CrMo 4 at HRC 45 (smaller grey arrows).

Assume that the SMG H5 nominal v<sub>c</sub> = 50 m/min / 164.04 sfm for a certain product and machining using a coated cemented carbide tools then, actual recommended v<sub>c</sub> = 50 m/min x 1.2 = 60 m/min / v<sub>c</sub> = 164.04 sfm x 1.2 = 196.85 sfm.

For further workpiece material details please see page(s) 806 - 813 and suggested cutting data at applicable pages.

For more convenient cutting data handling we recommend applicable tools in My Pages – on [www.secotools.com](http://www.secotools.com)

These cutting data compensations for steels are fully implemented at [www.secotools.com](http://www.secotools.com) in MyPages (see QR-code in the upper right corner).
