

Catalog & technical guide

# Solid End Mills 2026.1

At Seco, we make tools, tech, and solutions for the most advanced manufacturing challenges on Earth. From our founding in Fagersta Sweden, to today's global company, our business has always been made to measure, and built on trust.

Combining cutting-edge, precision tools with lasting, personal partnerships, we're a true people company helping our partners discover the future of the manufacturing industry.

We're proud to make for makers, invent for inventors, and partner with pioneers. Driving the future forward with our focus on innovation. In short - if the right tool for the job exists, we'll deliver it. If it doesn't, we'll create it.

We're proud to put sustainability at the heart of everything we do, challenging perceptions of our industry, changing the process of manufacturing, and playing our own small part in shaping a brighter looking future.

## Technical information

|                                |    |
|--------------------------------|----|
| Product overview .....         | 6  |
| Product summary .....          | 11 |
| Product description .....      | 14 |
| Services .....                 | 18 |
| Operation definitions .....    | 19 |
| Definition of strategies ..... | 21 |
| Pictograms (examples) .....    | 25 |
| ISO .....                      | 29 |

## Universal

|                          |     |
|--------------------------|-----|
| Product overview .....   | 31  |
| Tool selection .....     | 32  |
| C-series .....           | 38  |
| Solid <sup>2</sup> ..... | 75  |
| Stabilizer .....         | 140 |
| Solid <sup>2</sup> ..... | 166 |
| C-series .....           | 181 |
| Solid <sup>2</sup> ..... | 196 |
| C-series .....           | 210 |
| Solid <sup>2</sup> ..... | 214 |
| HSM/Tornado .....        | 222 |
| HFM .....                | 230 |

## Product family overview

### C-series

---

This range of Seco solid carbide end mills covers basic end mills for basic machining operations. It includes universal coated and uncoated endmills. The wide range of products for universal machining  
The Seco C-series are available in a wide range of chamfer, square end and ballnose geometries for roughing and finishing when side milling, face milling or slotting.

### SOLID<sup>2</sup>

---

Seco Solid<sup>2</sup> is a range of solid carbide end mills for applications in general machining, offering flexibility, speed and cost efficiency. Seco Solid<sup>2</sup> is available in a diameter range of  $\varnothing 1$ - $\varnothing 32$  mm and in *inch*  $\varnothing 1/32$  -  $1 \frac{1}{4}$ .  
Seco Solid<sup>2</sup> also includes a group of dedicated advanced roughing tools (JS564 and JS565).  
The 564 and 565 offer excellent performance when applied in well defined tool paths with constant arc of contact with high cutting speed and high cutting depth applications (advanced roughing).  
For the complete range of JS500 series tools all chamfer ( $c^{\circ}45^{\circ}$ ) have the following tolerances:  $c = DC \pm 0,01$ ,  $3 < DC \leq 6 \pm 0,02$ ,  $6 < DC \leq 10 \pm 0,03$ ,  $10 < DC \leq 14 \pm 0,04$ ,  $14 < DC \leq 18 \pm 0,05$ ,  $18 < DC \leq 24 \pm 0,06$ .  
Please see page 11 for a grouped overview of Seco Solid<sup>2</sup> products.

### Stabilizer

---

Seco Stabilizer series end mills use unique flute geometries for extremely aggressive metal removal rates in high-performance machining  
The Seco stabilizer are available in a wide range of square end and ballnose geometries for roughing operations when side milling, slot milling and advanced roughing.

### HSM/TORNADO

---

These tools are characterized by high precision tolerances, short cutting lengths, reduced necks and significant core diameters, maximizing rigidity. These tools have been developed to excel in peripheral milling and copy milling machining methods.  
Please see page 11 for a grouped overview of HSM/TORNADO (high speed machining) products.

## Product family overview

### HPM

---

Optimized endmills are dedicated for original equipment manufacturers and first-tier suppliers where large batches of a single component have to be machined and where processes need to be fully optimized to reduce cycle times, reducing costs per part.

Please see page 12 for a grouped overview of HPM (high performance machining) products.

### HFM

---

High feed machining is the first choice for applications with deep and shallow workpiece features, 3D profiling for mold & die applications and machining in unstable conditions. High feed tools excel in plunge milling machine methods.

Please see page 12 for a grouped overview of HFM (high feed machining) products.

## Product family overview

### MINI

Seco's range of micro solid carbide end mills consists of square end mills and ballnose cutters with small cutting diameters. Universal tools are applicable for common workpiece materials and specific tools are dedicated for graphite and hardened-steel applications. All tools have a thin layered coating for optimal performance in small-sized applications.

Please see page 12 for a grouped overview of MINI (micro machining) products.

### DIAMOND

Available in a variety of geometries and an extensive diameter range, these tools feature the best possible substrate to ensure the perfect adhesion of the diamond coating across a range of cutting parameters. Overall, these end mills significantly increase productivity and lower tooling costs by requiring fewer tool changes and being able to produce precision parts at high feed rates.

Please see page 12 for a grouped overview of DIAMOND (diamond coated) products.

### COMPOSITE

It consists of diamond-coated and uncoated solid carbide and PCD end mills incorporating different geometries as well as with PCD-brazed cutting edges. This is a product range offering optimized tools for difficult cutting conditions on challenging workpiece materials.

Please see page 12 for a grouped overview of COMPOSITE (JC) products.

### VHM

Includes universal coated and uncoated endmills, a range of products dedicated for machining plastics and aluminum, chamfer end mills and conical tools. These products consist of high-quality grades and coatings for predictable and premium tool life.

Please see page 13 for a grouped overview of VHM (general engineering) products.

## Product family overview

### CERAMIC

To cut the world's toughest heat-resistant superalloys (HRSA) quickly, you need a tool just as strong and advanced as the materials themselves. Streamline your processes and cut your HRSA parts considerably faster with these high-performance ceramic solid end mills. Please see page 13 for a grouped overview of CERAMIC products.

### HSS-CO

High speed steel cobalt is a premium grade that offers higher performance compared to traditional high speed steels. Due to increased hardness, these end mills last longer in today's abrasive, heat resistant and exotic materials. The high-quality, low-cost production advantages of these end mills are a direct result of engineered flute designs, wear resistant coatings and optimized features like internal coolant channels for these challenging materials. Please see page 13 for a grouped overview of HSS-CO products.

### X-Heads

With the Seco exchangeable head milling system, quickly and easily change between various solid carbide milling head profiles and types to optimize all your milling operations while you reduce manufacturing costs and tooling inventories. X-Heads end mills mount to a variety of available shank lengths for even greater versatility, with long-reach capability. End mill changes only require a simple turn of a wrench, and the shank could remain in the machine. Eliminate the need to reset tool lengths thanks to a secure and reliable connection that provides exchange accuracies within 50 microns. Please see page 609 for a grouped overview of X-heads (exchangeable heads) products.

| 1 | 2   | 3   | 4   | 5   | 6 | 7 | 8    | 10 | 11 | 12     |

### 1. Type of product

BLANK = Standard (catalogue) product  
R = Reconditioned product (complete)  
RK = Reconditioned product (frontal)

### 2. Product range

J = VHM  
JC = Composites  
JD = Diamond  
JH = HSM/Tornado  
JHF = HFM  
JHP = HPM  
JM = Mini  
JS = SOLID<sup>2</sup>

JPD = PCD  
JCO = HSS-Co  
JCG = Ceramic  
C = C-serie  
ST = Stabilizer  
XS\* = X-Head SOLID<sup>2</sup>  
XH\* = X-Head HSM/Tornado  
XV\* = X-Head VHM  
XHF = X-Head HFM

### 3. Geometry

A three-digit combination specifying the cutting geometry. Example: 111, 950, 553, 514, etc.

### 4. Connection size

This figure indicates the threading connection size between the head and adaptor  
E10 = 10 mm  
E12 = 12 mm  
E16 = 16 mm  
E20 = 20 mm  
E25 = 25 mm

### 5. Cutting diameter

Metric = 3 digit code (in case of 4 digit code – xx,xx mm)  
Imperial = a dot followed by a 3 digit code  
Example: (050 = metric, 5 mm) / (.500 = imperial, ½ inch)

## 6. Tool shape

| (DC = DMM)                                                                         |                                                                                    | (DC < DMM)                                                                        |                                                                                   |                                                                                      | (DC > DMM)                                                                          |
|------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|

| <b>D</b>                                                                           | <b>E</b>                                                                           | <b>F</b>                                                                          | <b>G</b>                                                                          | <b>J</b>                                                                             | <b>P</b>                                                                            |
| Form shape                                                                         |                                                                                    |                                                                                   |                                                                                   |                                                                                      |                                                                                     |
|  |  |                                                                                   |                                                                                   |  |                                                                                     |
| <b>N</b>                                                                           | <b>X</b>                                                                           |                                                                                   |                                                                                   | <b>T</b>                                                                             |                                                                                     |

## 7. Length of shape

A single digit that gives an indication of the length of the cutter compared to other products with the same cutting geometry.

## 9. Type of shank

.0 = Cylindrical  
.3 = Weldon  
.5 = Whistle Notch  
.9 = Safe-Lock

## 10. Number of flutes

This figure indicates the number of flutes in the cutter.  
Example: PCEDC2= 2 flutes, PCEDC6 = 6 flutes

## 11. Extension

BLANK = Standard  
A = Internal coolant channel(s)  
C = Chip splitters  
D = Double end  
NC = Numerical Control tolerance

## 12. Grades

4 character code specifying the coating on the cutter.

|        |           |        |      |
|--------|-----------|--------|------|
| MEGA = | MEGA      | DURA = | DURA |
| MT =   | MEGA-T    | NXT =  | NXT  |
| M64 =  | MEGA-64   | HXT =  | HXT  |
| M64 T= | MEGA-64-T | STAX = | STAX |
| SIRA = | SIRON-A   | TAN =  | TAN  |
| HEMI = | HEMI      | M9 =   | M9   |
| DIA =  | DIAMOND   | AXT =  | AXT  |

## 8. Tip shape

| Sharp                                                                             | Ball-nose                                                                         | Corner radius                                                                     | Concave radius                                                                    | Chamfer                                                                             | High feed                                                                           |

### Size of radius for convex and concave radius tipped products

000 = For metric products the tip shape is shown by a three-digit figure.  
By dividing this figure by 100 you will get the actual corner radius size in millimetres.

.000 = For imperial products the tip shape is shown by a dot, followed by a three-digit figure.  
This figure actually shows the size of the corner radius in *inch* (e.g. R.100 would indicate a radius of 0.100 *inch*).

## Code keys

### X-Heads – Shanks

|   |     |     |   |   |         |    |    |   |
|---|-----|-----|---|---|---------|----|----|---|
| X | E10 | 100 | E | 2 | - 055 - | 00 | .0 | S |
| 1 | 2   | 3   | 4 | 5 | 6       | 7  | 8  | 9 |

#### 1. Product range

X = X-Head Cylindrical shank

#### 2. Connection size

This figure indicates the threading connection size between the head and adaptor

E10 = 10 mm

E12 = 12 mm

E16 = 16 mm

E20 = 20 mm

E25 = 25 mm

#### 3. Shank diameter

Metric = 3 digit code

Imperial = a dot followed by a 3 digit code

Example: (050 = metric, 5 mm) / (.500 = imperial, 1/2 inch)

#### 4. Tool shape

| (DC = DMM)                                                                         | (DC < DMM)                                                                         |                                                                                      |
|------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
|  |  |  |
| <b>E</b>                                                                           | <b>G</b>                                                                           | <b>J</b>                                                                             |

#### 5. Length of shape

A single digit that gives an indication of the length of the cutter compared to other products with the same cutting geometry.

#### 6. Overall length

Metric = 3 digit code

Imperial = 3 digit code with a dot after the first digit

Example: (055 = metric, 55 mm) / (2.50 = imperial, 2 1/2 inch)

#### 7. Taper angle

Indicates the body half taper angle.

Example: (00 = 0°; 05 = 5°; 10 = 10°)

#### 8. Type of shank

.0 = Cylindrical

.3 = Weldon

.5 = Whistle Notch

.9 = Safe-Lock

#### 9. Type of material

Indicates the different shank materials that are available.

S = Steel

DM = Densimet

E = Solid Carbide

## How our solutions can benefit you

### The individual solution - Custom and modified tools

If the requirements are very special, we have the right solution with our individual and customized tools - solutions that have been tailored specifically to your individual requirements. This will enable you to take your machining productivity to a whole new level. In addition to the standard solutions, our offer includes:

#### Custom tools

They are modified geometries or form shaped tools for customer specific demands as we can fully cooperate with the customer and design a specific tool which answers the needs. Examples can be:

- Modified tools within a standard geometry
- MEP (Mechanised edge Profiling)
- Firtree,
- Dovetail
- Tapered ballnose
- Condyle cutter
- Form shaped tools
- Barrel

#### Modified tools

Seco offers a quick delivery solution for standard tools requiring modification to meet specific dimensional requirements as this can be:

- (full) Radius/Facet/Chamfer/Concave
- OD reduction (neck reduction), including increased length
- Coating (application for uncoated tools)
- Reduced cutting diameter
- Chip breakers
- Adding Weldon / Safelock
- External coolant channels

### Reconditioning cuts cost and tools inventory

Seco's modern carbide tools offer remarkable performance by utilizing the best combinations of carbide substrates with highly wear resistant coatings, optimized cutting geometry and controlled edge preparation.

However good a tool is, as part of its function, it will eventually show signs of wear on the cutting edge. Controlling this wear and the timely replacement of the tool will allow the used tool to be reconditioned, thus reducing tool investment costs. And we use the same advanced technology to recondition your solid carbide tools as we use to manufacture new products.

#### Your benefits from reconditioning

- Manufactured to Seco's high standards with the original Seco geometry, edge preparation and coating processes.
- Savings on tooling costs by repeated use of the same solid carbide tool.
- Our easy to use and free 'reconditioning box' includes a pre-prepared delivery note.
- Free, reliable collection on the following day when you call your Seco contact for pick up.
- An easy process due to the package service, reconditioning box and prepared delivery note.
- Delivery via the normal Seco channels.
- Safe transportation and storage of the reconditioned tools by packaging them in similar packaging as new tools.
- A new packaging label is included.
- Work towards greener and cleaner environment. -Seco's processes are globally certified with ISO14001.
- Guaranteed quality, as all processes are ISO9001 certified.

## Basic operations:

### Face milling:

Operation where the tool is in engagement with less than  $180^\circ$  arc of contact.

Tool engagement:

Small  $a_p$  and large  $a_e$ .

### Slot milling:

Operation where the full diameter is in engagement,  $a_e$  is equal to DC and  $a_p$  up to 2 times DC depending on the machining strategy in use.

### Side milling:

Operation where the side of the tool is in engagement,  $a_p$  is large and  $a_e$  is small.

### Copy milling:

Operation where the radius is in engagement.  $a_p$  and  $a_e$  are both small.

## Advanced machining methods:

### Ramping:

Opening up a pocket by making a Z axis at an angle.

### Helical interpolation ramping:

Opening a pocket by making a circular movement with the tool while ramping in Z axis.

### Trochoidal:

Opening a slot by using side milling, making a partial circular movement in X- or Y-axis. (changing slot milling into side milling).

### Push-pull:

Machining a 3D form by making a down and up copying movement following the profile of the form.

### Plunge milling:

Opening up a deep slot by using drilling (Z) axis.

### Z-leveling:

Machining a surface by making a small drilling or ramping in Z axis then opening the pocket with X and Y movements.

### Drilling:

Making a hole with movement in Z axis.

### Advanced roughing/ Optirough

Well defined tool paths with constant arc of contact for reliable roughing of simple & complex shapes. The large axial depths ( $a_p$ ) & small radial depths ( $a_e$ ) of cut combined with high feeds per tooth ( $f_z$ ) and cutting speeds ( $V_c$ ) results in high productivity.

## Definitions, machining strategies:

### General machining:

A machining strategy for general use.  $a_e - a_p$  ratio can vary depending on the operation.

Tool characteristics: Tools have relatively long cutting lengths and thin core diameters. There are no high requirements on the tolerances.

Machine requirements: There are no special machine requirements needed.

With basic CNC technology, difficult advanced machining methods are not possible.

Average results will be reached on metal removal rate  $Q$  (cm<sup>3</sup>/min).

The application area usually includes small batch sizes and a wide range of materials.

### High Performance Machining:

Is a machining strategy where very high metal removal rates can be achieved. Typical for this strategy is that  $a_e$  is 1 times DC and  $a_p$  is 1 to 1½ times DC depending the workpiece material.

With HPM (High Performance Machining) you achieve an extremely high metal removal rate by using a much higher chip load than in general machining.

Tool characteristics: Specially developed chip formers in the flute of the tool, tip protection with a small 45° face or corner radius, special smooth formed chip space and coating, with or without Weldon shank.

Machine requirements: High stability, high power requirements, CNC control, rigid clamping system.

The application areas are: Operations in a mass production environment where production time/lead time is of great importance or on single products where a high metal removal rate  $Q$  (cm<sup>3</sup>/min.) is required.

### High Feed Machining:

Is a machining strategy where high feed rates can be reached with large radial engagements ( $a_e$ ) in combination with a small  $a_p$ .

With HFM (High Feed Machining) you achieve high metal removal rates and/or surface finish by using a much higher table feed compared to general machining.

Tool characteristics: Specially developed front teeth, very short cutting length and coating.

Machine requirements: Good stability, CNC, possibility for high table feed ( $v_f$ ).

The big advantage of this technology is that it is very user friendly, easy, safe and quick to program in CAM. By using the so called Z-leveling strategy it is relatively easy to program complex forms without the necessity of having extensive experience in programming.

The application area is: From soft to hardened steel, titanium and stainless steel and it is very good as a pre operation before HSM is used.

It can also be applied in deep pocket machining.

### Micro machining:

Is a machining strategy where extremely small tool diameters are used.

Tool characteristics: Diameter range Ø 0,1 to 2,0 mm, small cutting lengths, a wide range of OD reductions, high accuracy, coating.

Machine requirements: High spindle accuracy, high RPM, CNC, thermal stability against spindle growth.

Application area is: Production of cavities like slots, pockets, holes or engravings in many types of material.

### High speed machining:

Is a machining strategy where a combination of a small radial depth of cut and high cutting speed and table feeds are used.

Depending on the method a high metal removal and a low  $R_a$  value can be reached.

Typical for this strategy are the low cutting forces, less heat build up in tool and workpiece, less burr formation and high dimensional accuracy on the workpiece.

With HSM (High Speed Machining) you achieve high metal removal rate and/or surface finish by using a much higher cutting speed compared to general machining.

Tool characteristics: Stable, (thick core diameter and a short cutting length) clear and well formed chip space for good chip evacuation, coating.

Machine requirements: Quick CNC control, high RPM, quick transmission to the axis.

The applications area is: Mould & Die industry on pre-finishing and finishing operations in hardened steel (48-62 HRC) in a short lead time.

This technique can also be applied in most other materials when using the right tool and advanced machining method.

### Advanced roughing / Optirough:

Well defined tool paths with constant arc of contact for reliable roughing of simple & complex shapes. The large axial depths ( $a_p$ ) & small radial depths ( $a_e$ ) of cut combined with high feeds per tooth ( $f_z$ ) and cutting speeds ( $V_c$ ) results in high productivity.

These CAM-based rough-machining, or dynamic milling, strategies are ones that centre on a cutting tool's arc of contact and its average chip load.

When reducing the arc of contact, the amount of heat generated during roughing operations is reduced. As the radial depth of cut decreases, so does a cutter's arc of contact. A smaller amount of contact results in less friction and, therefore, less heat between the tool's cutting edges and the workpiece it is machining. These lower machining temperatures, in turn, allow for increased cutting speeds shorter cycle times.

## Explanation of Advanced Roughing

### Advanced Roughing, what does it mean?

Today's CAM packages offer toolpath strategies specifically for inside/outside radii shapes where changing arcs of contact are common when using conventional toolpaths. These software packages automatically apply different feeds to control arc of contact and keep chip loads consistent.

These CAM-based rough-machining, or advanced roughing, focus on a cutting tool's arc of contact and its average chip load. When reducing the arc of contact, the amount of heat generated during roughing operations is reduced. As the radial depth of cut decreases, so does a cutter's arc of contact. A smaller amount of contact results in less friction and, therefore, less heat between the tool's cutting edges and the workpiece it is machining. These lower machining temperatures, in turn, allow for increased cutting speeds shorter cycle times. Also, the resulting cutting force is lower, allowing high APMXS, or cutting depth to be programmed.

In advanced roughing, to maintain arc of contact, CAM packages need to employ trochoidal machining-like techniques when entering a radius.

When using an optimized roughing toolpath and maintaining consistent arc of contact, the cutter's radius can match that of the inside radius being cut without risk of cutter overload. This capability allows our Advanced Roughing tools (JS554-3C, JS564, JS565, JS754, JS755, JSS720 and S4651) to remove more stock in the roughing pass, thus reducing the amount of stock the finish pass has to cut – all of which translates to faster machining cycle times and longer tool life. Also, while the remaining stock is constant the finishing tool can generate a better final surface quality and at the same time will have longer tool life.

### Impact of arc of contact on cutting speed and feed per tooth

## How our products can benefit you

### Achieve Revolutionary speeds in superalloys with

#### Seco Ceramic end mills

SiAlON ceramics, high-strength geometries and reinforced frontal teeth are some of the main features of these highly optimized tools and allow full utilization of high speed, high-performance machine tools. The tools can operate at cutting speeds of up to 1200M/min and can offer a significant productivity increase when compared to standard solid carbide solutions.

Since high temperatures are needed, also a significant amount of RPM is needed in order to achieve the high vc. The high temperatures are required in order to reach a level where the HRSA softens (850c +). With these tools, multiple strategies can be applied as long as a constant cut and constant contact with the workpiece is maximized.

The tool is designed for side milling, slot milling, high-feed milling and advanced roughing! All these are possible. To maintain the high cutting temperature in the cutting zone, coolant is compressed air. Because the tool operates at high speeds, also run out is of high importance.

You can find Seco ceramic tools on page 2, 399.

### Simplify aerospace hybrid materials holemaking with two-in-one-geometry

The JC899 has a patented two-in-one double geometry solution, designed for machining hybrid stacked material combinations such as CFRP-Ti and CFRP-Alu. Due to its left-hand helix, right-hand cut design, this tool is preventing delamination, fiber pull-out and chip marks from damaging the workpiece surface (this as chips will be pushed downwards out of the hole). As a result, the JC899 left-hand helix, right-hand cut STAX finisher gives a perfect surface finish and prevents chip pollution between the 2 stack layers.

This means post-machining, unstacking, cleaning and deburring, and re-stacking is not needed anymore which can boost process efficiency by as much as 200 to 300 percent and provide tool life three to six times longer than that of conventional reamers.

At the same time the drilling process is replaced by applying the JC898 high feed rougher. This tool helical interpolates and allows the JC899 to operate in continuous stock conditions, maximizing quality output while minimizing corellation in hole size and tolerance.

You can find Seco JC898/JC899 on pages 576 - 578.

### Take bigger stepovers for faster finishing productivity

For the fastest, most reliable finishing operations, new barrel-shaped tools use an innovative "taper" or "drop" geometry to enable large increases in stepover. This is possible through the use of advanced CAD/CAM systems or new plugins built for the uses of these tools. Using 5-axis machine movement, the tool's cutting profile can remain engaged with the surface of the part at the proper angle at all times.

In addition to our standard barrel-style shapes, Seco can also offer all styles of barrel geometry's as custom products, such as lens shapes, ensuring you always have access to the ideal tools for your part-production needs.

### Take the risk out of micro milling operations

Achieve accuracy, precision and high surface finish quality from the very start when machining small, micro-sized surfaces with our range of solid-carbide Seco end mills. SECO's new Mini ranges deliver longer tool life, stability and peace of mind for machining operations where it is typically impossible to actually see the workpiece and cutting tool as it works.

Precisely produced geometries, virtually zero runout, advanced coatings and true line-form radius tolerances give these mini ranges its incredibly long tool life and reliability. Key is to apply these tools in suitable conditions, in which the benefits can be maximized. Minimize run-out of the tool plus the tool holder is essential. Also the CAM program can be optimized with the Seco feed optimizer which calculates the ideal RPM and feed speed (vf) for every application. As a result, the tool and set-up help to eliminate any unforeseen problems during rough, pre-finish and final finish micro milling operations.

You can find an overview of Seco Mini tools on page 12.

### JS522 long flute finisher

The JS522 long-flute finishing tool is capable of meeting the aerospace industry's stringent criteria for perpendicularity, fine surface finish, high metal removal rates and more effective machining.

With a cutting length of 5"Dc, an increased core diameter and a slightly negative taper to compensate deflection, the JS522 is specially designed to machine high shoulders in single-pass finishing operations. This single pass saves time (up to 80%) but most important, also delivers instant quality. This tool is often used in mass production areas.

Once in place and optimized, this has proven to be the number one cost saver in multiple applications!

You can find Seco JS522 on page 178.

## UNIVERSAL

Seco offers a complete range of high performance solid carbide square shoulder end mills, ballnose cutters and finish end mills for high productivity and extended tool life. This range covers universal products and optimized end mills for specific workpiece materials.

Universal products offer full machining flexibility at an excellent price/performance ratio.

- C5121, C5131, C5141, C5231, C5241 and ST5551 for sharp corner type.
- JSE512, JSE513, JSE514, JS553, JS554, ST5551, JS564, JS565 and JS520 with 45° chamfer type.
- C5121, C5141, JS522, JS553, JS554, ST5551, JH910, JH930, JHF980, J36, V31, JME542, JME562 and JME564 for radius type.
- C5021, C5041, JS506, JS509, HK, HKM and J29 for conical type.
- C5321, C5341, JSB512, JS532, JS533, JS534, JHB970, JMB542, JMB562 and JMB563 for ball-nose type.

For cutting data recalculations, see pages 699 – 707

SMG = Seco material group

Coolant = A=air D=dry E=emulsion M=mist spray

$v_c$  = m/min (sf/min)

$f_z$  = mm (in/tooth)

$a_p$  = mm/DC (in/DC) = factor

$a_e$  = mm/DC (in/DC) = factor

All cutting data are target values

JS553

High performance – Universal – Square – 3 Flutes – Cylindrical – Sharp

- Tolerances:
- DMM=h5
- DC=e7
- Regrind possible if DC is  $\geq \varnothing 6$

## STEEL AND CAST IRON

Seco offers a complete range of high performance solid carbide square shoulder end mills, ballnose cutters and finish end mills for high productivity in steel and cast iron.

- ST5541, JHP993, JHP951 and JH142 for chamfer or radius type.
- ST5341, JHB970, JH112, JH150, JH160 for ball-nose type.

## JHP993

High performance – Steel – Square – 3-5 Flutes – Cylindrical – Chamfer

- Tolerances:
- DMM=h5
- DC=-0,02/-0,1 mm
- CHW=  $\pm 0,05$  mm
- Regrind possible if DC is  $\geq 06$

## JHP951

High performance – Square – Steel – 3-5 Flutes – Weldon – Corner radius or chamfer

- Tolerances:
- DMM=h5
- DC=e7
- RE= ±0,02 mm
- Regrind possible if DC is ≥Ø6

## STAINLESS AND S-MATERIALS

Seco offers a complete range of high performance solid carbide square shoulder end mills, ballnose cutters and finish end mills for high productivity in stainless steel and ISO S-materials.

- JS754, JS755, JS720, JHP751, JHP760, JHP770, JHP780, JHP794, JCG790, JH770, JH740, JH710, JH790, JH730, JHP994, SHF712, SME714, SME716 and JCO710 for chamfer or radius type.
- JS730, JH780, JHB720, JH721, JH722, SMB713, SMB714 and SMB716 for ball-nose type.
- JH724, JH726, JH734, JH736, JH744, JH746 for barrel type.
