|   | Aluminium Alloy                     | Content 5%≤Si≤10%        | RT9010         |                       |     |     | 200 | 500 |         |
|   | Aluminium Alloy                     | Content Si>10%           | RT9010         |                       | 100 | 200 |     |     |         |

Note 1) For RT9010, VP10RT, VP20RT and MY5015, wet cutting is recommended.

## RECOMMENDED CUTTING CONDITIONS [For External Grooving / Cutting Off]

Recommended cutting conditions when combining a GYHR/L2525M00/90-M25R/L modular holder and GYM25R/LA-○○○ modular blade.

### ■ In the case of mono block type holder for Swiss style lathes

Please refer to the tables above on recommended cutting conditions for external grooving and cutting off.  
Apply the percentage ratio shown on each shank size with the values in the table.

RECOMMENDED CUTTING CONDITIONS [For External Grooving / Cutting Off]

\*Below are the recommended cutting conditions when using the modular holder GYHR/L2525M00/90-M25R/L with the modular blade GYM25R/LA-○○○.

## BM BREAKER

### Minimum grooving diameter

Ensure the tool is suitable for the diameter being machined. Refer to the Min. Grooving Diameter DMIN as shown in the table on page F042, F099 to avoid a collision with the workpiece as shown below.

### Recommended feed rate and depth of cut

## TOOL SELECTION

### Notes when selecting the tool body

**Modular holder**

GYM25 GYHR2525M00-M25R 25mm ✓

GYM25 GYHR2020K00-M25R 20mm ✗

Modular Holder

- To ensure sufficient clamping rigidity, select a modular holder with the largest possible shank size.

**Modular blade (1)**

GYM25 GYHR2020K00-M25R 25mm ✓

GYM20 GYHR2020K00-M20R 20mm ✗

Modular Blade

- If there is no restriction for use, select the largest modular blade for the same shank size.

**Modular blade (2)**

✓ ✗

● Select the shortest possible blade suitable for the application.

**Modular blade (3)**

✓ ✗

● Select the shortest possible blade suitable for the application.

### Notes when setting the tool

**Setting of cutting edge height**

<Grooving/Cross-feed machining>  
Set the cutting edge height to  $\pm 0.1\text{mm}$  parallel to the central axis.

<Cutting off>  
Set the cutting edge height to  $0-+0.2\text{mm}$  parallel to the central axis.

**Tool body setting angle**

90° 90°

- Set the insert perpendicular to the central axis.

**Overhang**

- When setting the tool, ensure that the overhang is as short as possible and avoid contact of the tool post with the top clamp as shown in the figures above.

## MACHINING RECOMMENDATIONS

### Notes on multi-functional machining (MF, MS and MM breakers)

#### Machining narrow grooves

- It is recommended to carry out plunging in several passes. Following the steps above makes it difficult for chips to elongate. This also improves the accuracy of workpiece wall surface.

#### Machining wide grooves

- It is recommended that cross-feed machining is used.

#### Machining wide grooves

##### ROUGHING

- ① Carry out grooving.
  - ② Retract the tool approx 0.1 mm.
  - ③ Carry out cross feed machining.
  - ④ Retract the tool approx 0.1 mm.
  - ⑤ Carry out grooving.
  - ⑥ Retract the tool approx 0.1 mm.
- \* Repeat the steps ①-⑥.

##### FINISHING

- ⑦ Carry out grooving to the end point of the corner radius.
- ⑧ Machining of the wall surface, corner radius and bottom face should be carried out in one process.

##### FINISHING

- ⑨ Stop at the bottom of the corner radius.
- ⑩ Machine the counter wall to the corner radius in one process.
- ⑪ Finish machining.

#### Precautions when finishing walls

- To produce high accuracy walls using MS or MM chipbreaker insert, do not carry out back turning. Plunging is recommended.

#### Wall machining

- When machining a wall, chip jamming can occur. In this case, stop cross feed machining just before the wall (at a point less than the insert width) then remove the remaining material by plunging.

#### Machining of a ring section

- When a ring remains in a cross feed end process, finish cross feed machining 1-1.5 mm short of the end point, then remove the ring by plunging.

MACHINING RECOMMENDATIONS

Notes on multi-functional machining (BM chipbreaker)

**Copying**

● With the BM chipbreaker insert, 3 dimensional copying is possible. Set the depth of cut (APMX) to 40% less than the insert width.

**Roughing**

● Use plunging and cross-feed machining. When machining the corner, vibration is likely to occur. To avoid this, reduce the feed by 50%.

**Finishing**

● Carry out finishing in one process. For the depth of cut (APMX 2) when back turning, refer to the table on the right.

| Insert           | APMX 2 (mm) |
|------------------|-------------|

Notes for cutting off

**Feed**

<Feed>

● When the cutting edge approaches the centre, reduce the feed by 50%.

● If necessary, stop the feed prior to reaching the centre of the workpiece to prevent it falling under its own weight.

**Revolution**

<Spindle speed>

● When using constant cutting speed during a cutting off cycle, it is recommended to limit the spindle speed to 80% of maximum to ensure stability.

● To prevent the workpiece from being expelled, lower the spindle speed before finishing the grooving operation.

**Insert**

Neutral insert

Handed insert

Neutral insert

Handed insert

● When there is a centre stub on solid bar work or burrs are formed on pipe material, it is possible to decrease them by using a handed insert. With a handed insert, machining tends to be less stable when compared to using a neutral insert. Pay special attention to avoid fracturing of the cutting edge and decrease the feed when necessary.

## RELATIONSHIP BETWEEN THE MODULAR BLADE AND FEED PER ROTATION [For Face Grooving]

Note 1) Adjust the feed per rotation in the cutting conditions to the percentage shown in the table above.

## RECOMMENDED CUTTING SPEED [For Face Grooving]

|   | Material                            | Hardness                 | Grade  | Cutting Speed (m/min) |     |     |     |     |     |
|---|-------------------------------------|--------------------------|--------|-----------------------|-----|-----|-----|-----|-----|
|   |                                     |                          |        | 50                    | 100 | 150 | 200 | 250 | 300 |

| H | Hardened Steel                      | 50HRC≤                   | BC8110 |                       | 60  | 120 |     |     |     |

Note 1) For VP10RT, VP20RT and MY5015, wet cutting is recommended.

## RECOMMENDED CUTTING CONDITIONS [For Face Grooving]

### GROOVING

### PLUNGING

### TRAVERSE MACHINING (MF BREAKER)

### TRAVERSE MACHINING (MM/MS BREAKER)

### TRAVERSE MACHINING (BM BREAKER)

## TOOL SELECTION

### Notes when selecting the tool body

#### Modular blade (1)

#### Modular blade (2)

#### Modular blade (3)

At first machine the maximum cutting diameter, there is no restriction in the cutting diameter on the remaining process.

● When plunging in several passes.

● When combining plunging and infeed machining.

#### Modular holder

● Select a modular holder with the largest possible shank size to maintain mounting rigidity.

## Notes when setting the tool

### Setting the cutting edge height

- Set the cutting edge height to  $\pm 0.1\text{mm}$  parallel to the central axis.
- Cutting edge centre height check should be done by traverse machining towards the centre with a very small depth of cut and ensure that an even surface and no material remains at the centre point afterwards.

### When interfering the wall of groove and the modular blade

- If interference occurs even when the correct blade is used, the cutting edge height could be incorrect.

{ When interference occurs on the inner side of the blade, the cutting edge height is set too high.  
When interference occurs on the outer side of the blade, the cutting edge height is set too low.

### Setting the tool

- Set the insert parallel to the central axis.

### Tool overhang

- When setting the tool, ensure that the overhang is as short as possible and avoid contact of the tool post with the top clamp as shown in the figures above.

F

GROOVING / CUTTING OFF

## MACHINING RECOMMENDATIONS

### Notes when face grooving

- Always machine from the outer diameter towards the centre.

#### Machining narrow grooves

- Plunging in several passes is recommended.

#### Machining wide grooves

- Cross feed machining is recommended.

## MACHINING RECOMMENDATIONS

### Notes when face grooving

#### Notes on the first pass (1)

- During the first face grooving pass it is difficult to disperse broken chips and can lead to problems such as a chipped insert. Maintain longer chips that disperse easily by decreasing the feed per rotation.

#### Notes on the first pass (2)

- When chips become too long, use peck feed to break them into a suitable length.

#### Notes when wide face grooving by plunging in several passes

- When machining a face groove in several passes, machine from the outer diameter towards the centre so that space for discharging chips is created to prevent insert damage caused by chip jamming.
- Plunging width of cut is recommended to be set at 60 - 80% of the insert width. This enhances the effect of the chipbreaker by enlarging the width of the groove to improve chip dispersal.

#### Notes when wide face grooving by combination of plunging and traverse machining (1)

- When face groove machining by using plunge feed and traverse machining, always machine from the outer diameter towards the centre to disperse chips outward to avoid chip jamming problems.
- Set the depth of cut within 40% of the insert width.

## Notes when wide face grooving by combination of plunging and traverse machining (2)

- When infeed machining at the bottom of a deep groove, chips may interfere on the cutting edge near the centre wall. In such cases, stop infeed machining just before the centre wall (at a point less than the insert width) then remove the remaining material by plunging.

## Notes when copying (BM Chipbreaker)

- With the BM chipbreaker insert, 3 dimensional copying is possible. Set the depth of cut (APMX 2) to 30% less than the insert width.

## Finishing (1)

- When finish cutting, machine continuously from the outer wall to the bottom of the groove, then finally plunge cut the centre wall.

## Finishing (2) (BM Chipbreaker)

- Carry out finishing in one process. For the depth of cut (APMX 2) when back turning, refer to the table on the right.

| Insert           | APMX 2 (mm) |
|------------------|-------------|
| GY2M0200D100N-BM | 0.10        |
| GY2M0250E125N-BM |             |

|   | Aluminium Alloy                     | Content Si>10%              | RT9010        |                       | 80  |     | 160 |     |     |     |

Note 1) VP20RT is the first recommended grade for materials other than hardened steels.

Note 2) For RT9010, VP10RT, VP20RT and MY5015, wet cutting is recommended.

## RECOMMENDED CUTTING CONDITIONS [For Internal Grooving]

### GROOVING

### GROOVING (GL BREAKER)

## TRAVERSE MACHINING (MF BREAKER)

- When traverse machining a blind hole, it is recommended to carry out back turning considering chip disposal.

## TRAVERSE MACHINING (MM/MS BREAKER)

- When traverse machining a blind hole, it is recommended to carry out back turning considering chip disposal.

Note 1) The above cutting conditions are for when using the tool overhang (LU) 1.6-2.0 times larger than the shank diameter (DCONMS).  
(L/D=1.6-2.0) When using L/D larger than 2.0, reduce the cutting conditions.

| Seat Size |                   |   |      |
|-----------|-------------------|---|------|
|           | Insert Width (mm) |   |      |
| D         | 2.00              | G | 4.00 |
|           | 2.24              |   | 4.24 |
| E         | 2.39              | H | 4.75 |
|           | 2.50              |   | 5.00 |
|           | 2.74              |   | 5.24 |
| F         | 3.00              | J | 6.00 |
|           | 3.18              |   | 6.31 |
|           | 3.24              |   | 6.35 |

## LIMITATION OF THE MAXIMUM GROOVE DEPTH [For Internal Grooving]

### ●When using the monoblock type

The maximum groove depth is not limited by the cutting diameter.

### ●When using the modular blade type

The maximum groove depth is limited by the cutting diameter.

Due to interference of this part, the maximum groove depth is limited by the cutting diameter.

#### ●Shank Diameter=32mm (GYM20 Blade)

#### ●Shank Diameter=40mm (GYM20 Blade)

#### ●Shank Diameter=40mm (GYM25 Blade)

#### ●Shank Diameter=50mm (GYM25 Blade)

## TOOL SELECTION

### Notes when selecting the tool body

**Holder**

● When the overhang is the same, select a holder with the largest possible shank size to ensure sufficient clamping rigidity.

**Modular blade (1)**

**GYM20R/LA-0000**

GYM20R/LA-D10  
GYM20R/LA-E10  
GYM20R/LA-F10  
GYM20R/LA-G12  
GYM20R/LA-H12

**GYM25R/LA-0000**

GYM25R/LA-D12  
GYM25R/LA-E12  
GYM25R/LA-F12  
GYM25R/LA-G14  
GYM25R/LA-H14  
GYM25R/LA-J14

● For an internal holder, select a modular blade listed above.

**Modular blade (2)**

● For a Ø40 shank holder, if there is no restriction for use, select a holder suitable for GYM25 blade.

### Notes when setting the tool

**Overhang**

● The maximum groove depth is limited to the dimension LDRED. When machining with longer overhangs, refer to the dimension WF2 of the tool used.

## MACHINING RECOMMENDATIONS

### Notes on multi-function machining (MF, MS and MM breakers)

For internal grooving, the machining methods for external grooving can be used, but please note the following precautions.

#### Coolant

- Supply large amounts of coolant for effective chip disposal during cutting. Maintain supply until the tool has been retracted completely for improved chip disposal.

#### Machining blind holes

- As continuous chips tend to elongate at the back of the bore, the above operation is recommended. The recommended width of cut for ② is 0.5 mm.

#### Machining Wide Grooves

##### Grooving

- When the cutting edge width is  $\times 2 \geq$  groove width

- When the depth of cut is shallower than the cutting edge width, continuous chips are usually produced. When plunging in several passes, it is recommended to carry out machining in the steps above. This ensures that coolant reaches the cutting edge and chips are easily discharged.

- When the cutting edge width is  $\times 2 <$  groove width

- When the groove depth is larger than the cutting edge width, carry out plunging in the steps above to break up chips efficiently.

##### Turning

- When chip breaking and disposal are especially important, cross-feed machining is recommended.
- Wide face grooving when the corner R of the work piece is equal to the corner R of the insert, machine as shown above. (When corner R of the material is larger than corner R of the insert, refer to the description of external wide grooving.)
- If the groove depth exceeds a given level, chips may elongate at the wall. In such a case, increase the feed and carry out machining as shown above.

#### Machining instruction

- It is recommended to carry out grooving from the front end of the workpiece. This reduces workpiece deflection.

**GW**SERIES**Easy to Utilise Configuration that Improves Tool Handling****Clamping method****Simple insert clamping method offering high rigidity**

To prevent extraction during machining, the insert features a reverse taper angle. Additionally the design also includes 3 large locating faces with the blade offering increased cutting edge reliability.

The blade itself is made from a suitable, special alloy steel. For changing the insert, a unique wrench is supplied to ensure ease of use.

Reverse Taper Angle

**Voice of the Developer****Easy insert setting**

By using the unique wrench, it is possible to remove the insert with one simple action making it easier for everyday use in the workshop.

## Through Coolant Blade

### Increased wear resistance due to 2 through coolant holes

2 through holes supply coolant to both the rake and flank face, leading to effective cutting edge cooling and increased wear resistance.

Additionally the blade can also be utilised with both low and high pressure coolant (7MPa).

#### Voice of the Developer

##### Reduced heat generation

The 2 coolant holes used in the blade are capable of coping with pressures up to 7MPa. This is achieved by using as large as possible hole diameter. The coolant holes are located close to the cutting edge to improve cutting edge cooling effect and increasing wear resistance.

## Coolant Ports

### Flexibility with the use of 6 coolant ports

There are 6 coolant ports designed into the tool block, making it easy to set up the block and blade to a suitable configuration. The through coolant holes improve cutting edge cooling and chip evacuation.

The use of external coolant hoses is also possible.

#### Voice of the Developer

##### Possible to set up to suit the requirements of the workshop environment.

One of the objectives of this product is to respond to the customers complaints that "the product did not fit and could not be used". Starting with the coolant outlet that prevents leaks even when oil quantity or overhangs change, everything from the material and the shape of the O-ring, to the length of the hose has been tailored to the effective use in the workshop.

## Chipbreaker System Offering Excellent Chip Disposal Properties

### Low Feeds

### Medium Feeds

### VP20RT (1st Recommendation)

- PVD coated grade suitable for a wide range of applications. The combination of a special tough cemented carbide substrate with MIRACLE coating provides an excellent balance of wear and fracture resistance.

MIRACLE Coating

Carbide Substrate (90.5HRA)

### MY5015

- CVD coated grade with excellent wear resistance even at high temperatures. Providing longer tool life when machining cast and ductile cast irons. Also suitable for high speed continuous cutting of steels.

CVD Coated Carbide

Carbide Substrate

### VP10RT

- PVD coated grade with a cemented carbide substrate harder than VP20RT. For use on difficult-to-cut materials and for extending tool life.

MIRACLE Coating

Carbide Substrate (92.0HRA)

### VP30RT

- A combination of a tough, special cemented carbide substrate and MIRACLE coating. Ideal for heavy interrupted cutting of stainless and general steels.

MIRACLE Coating (Al,Ti)N

Carbide Substrate (88.8HRA)

● : Standard insert with dimensions

# GROOVING / CUTTING OFF

# GW BLADE

- Simple insert clamping method offering high rigidity.
- Possible to use with both external or through coolant.
- Groove Depth CW 2.0—5.0 mm

## For External Cutting Off / Grooving

F

GROOVING / CUTTING OFF

## LIMITATION OF THE MAXIMUM GROOVE DEPTH [For External Grooving]

The maximum groove depth is limited by the workpiece diameter.

Due to interference, the maximum groove depth is limited by the workpiece diameter.

This image shows a full page of a document template designed for writing. At the top left, there is a header area labeled "Memo" in a bold, black font. Below this header, the entire page is filled with horizontal ruling lines, which are thin and light gray, providing a guide for handwriting or typing. The lines are evenly spaced and extend across the width of the page.

# GROOVING / CUTTING OFF

## MG HOLDER

- Clamp-on type
- Positive insert suffers from negligible chattering and thus produces a good finished surface.
- Cutting width CW 1.25—6.0mm

### External grooving

Right hand tool holder shown.

## RECOMMENDED CUTTING CONDITIONS

|          | Material                   | Hardness                    | Cutting Speed (m/min) | Feed (mm/rev)    |                      | Recommended Tool Overhang (mm) |
|----------|----------------------------|-----------------------------|-----------------------|------------------|----------------------|--------------------------------|
|          |                            |                             |                       | CG03RS/CG04RS    | CG05RS/CG06RS/CG07RS |                                |
| <b>P</b> | Carbon Steel · Alloy Steel | 180—280HB                   | 80 (40—120)           | 0.02 (0.01—0.03) | 0.03 (0.01—0.05)     |                                |
| <b>M</b> | Stainless Steel            | ≤200HB                      | 80 (40—120)           | 0.02 (0.01—0.03) | 0.03 (0.01—0.05)     |                                |
| <b>K</b> | Gray Cast Iron             | Tensile Strength<br>≤350MPa | 80 (40—120)           | 0.03 (0.01—0.05) | 0.03 (0.01—0.05)     |                                |
| <b>N</b> | Non-ferrous Metal          | —                           | 120 (80—160)          | 0.03 (0.01—0.05) | 0.05 (0.01—0.08)     |                                |

Note 1) Wet cutting is recommended.

## ■ PRECAUTIONS WHEN USING THE MICRO-MINI TWIN

● When using a holder for general purpose / small automatic lathe:

① To avoid chipping of the 2nd cutting edge take care when inserting the boring bar into the holder. Refer to fig.1. If the 2nd edge contacts the internal face of the holder there is a possibility that it may chip.

② When using this type of holder, there is a possibility that damage to the shank and the 2nd cutting edge can occur. Make sure that the clamping screws are tightened to the set torque value. Additionally make sure that there is no clamping screw near the 2nd cutting edge as this can break the boring bar.

◎ When using Mitsubishi Materials holders

When using holders with a tool overhang of recommended quantity, ensure that the 3rd clamping screw is removed prior to machining. The set torque value for the clamping screw is 2.0 N·m.

● When using a square type holder:

① When installing the boring bar into the holder, tighten the clamp screws after ensuring the flats on the tool holder are parallel to the reference flats on the micro-mini bar. Refer to fig.3.

② Make sure that the clamping screws are tightened to the recommended values.

③ Do not tighten the clamp screw without a bar in place, otherwise the bridge will be deformed.

★ L24 is the length of overhang for sufficient clamping, and ( ) is the recommended length for steel machining and for general purpose.  
Note 1) The MICRO-DEX and the MICRO-MINI cannot be fitted to square holders.

This image shows a blank sheet of white paper designed as a memo template. At the top left, the word "Memo" is written in a bold, black, sans-serif font. A thick horizontal black line runs across the entire width of the page directly below the header. The main body of the page is filled with horizontal dashed lines, providing space for writing. The paper has a clean, minimalist aesthetic.

① Classified according to external or internal applications.  
② Sub-classified according to product series.  
(Refer to the index on the next page.)

**TYPE OF TOOL HOLDER**  
Indicates the initial letters for the order number and cutting applications.

PRODUCT SECTION

PRODUCT FEATURES

**INTERNAL THREADING**

**MMT<sup>®</sup> TYPE BORING BARS**

- Minimum cutting diameter 13mm.
- Various insert types.
- Precision class insert.
- Available with a wiper cutting edge to provide a precise thread geometry.
- Capable to machine lead angle  $\leq 0.005\text{mm}$ .

Wiper : Insert order number is determined by the selected pitch.

General : An insert is applicable to several pitch types.

# FEATURES OF MMT SERIES

## ■ A WIDE VARIETY OF PRODUCTS

Mitsubishi Materials Threading (MMT) series.

### M-CLASS INSERTS WITH 3-D CHIPBREAKERS

### G-CLASS GROUND INSERTS

## ■ IDEAL CHIP CONTROL EVEN DURING THE LATTER HALF OF PASSES WHEN CONTINUOUS CHIPS ARE USUALLY PRODUCED. (M-CLASS INSERTS WITH 3-D CHIPBREAKERS)

ISO metric external thread pitch 1.5mm Final pass (6th pass)

<Cutting Conditions>

Material : DIN 41CrMo4  
Insert : MMT16ER150ISO-S  
Grade : VP15TF  
Cutting speed : 120m/min  
Cutting method : Radial Infeed  
Depth of cut : Fixed cut area  
Pass : 6 times  
Coolant : Wet

## ■ A HIGHER LEVEL OF PRECISION THAN CONVENTIONAL INSERTS (G-CLASS GROUND INSERTS)

High precision threading can be achieved by using MMT inserts that feature a ground rake faces and peripheral cutting edges.

| Thread Type                 | Threading Tolerance |
|-----------------------------|---------------------|
| ISO Metric                  | 6g / 6H             |
| American UN                 | 2A / 2B             |
| Whitworth for BSW, BSP      | Medium Class A      |
| BSPT                        | Standard BSPT       |
| Round DIN 405               | 7h / 7H             |
| ISO Trapezoidal 30°         | 7e / 7H             |
| American ACME               | 3G                  |
| UNJ                         | 3A                  |
| API Buttress Casing         | Standard API        |
| API Rounded Casing & Tubing | Standard API RD     |
| American NPT                | Standard NPT        |
| American NPTF               | Class2              |

## ■ HOLDER (Use of special surface treatment)

### External

### Internal

★ Order number of coolant guide screw: TFS03006  
(Except MMTIR1316/MMTIR1516)

## ■ SUITABLE FOR THREADING WITH A LARGE LEAD ANGLE

By changing only the shim, MMT holders can be used for turning of threads with various lead angles as well as the turning of left hand threads.

| Lead Angle ( $\alpha^\circ$ ) | Inclination Angle ( $\theta^\circ$ ) |
|-------------------------------|--------------------------------------|
| -1.5°                         | -3°                                  |
| -0.5°                         | -2°                                  |
| 0.5°                          | -1°                                  |
| 1.5°                          | 0°                                   |
| 2.5°                          | 1°                                   |
| 3.5°                          | 2°                                   |
| 4.5°                          | 3°                                   |

Standard shim delivered with the holder.

## ■ GRADE

### VP10MF (G-class ground inserts only)

#### ● Superior wear and plastic deformation resistance

- High wear and plastic deformation resistance for threading when maintaining the thread form is important. Suitable for continuous high precision machining with extensive tool life.
- Effective in combination with G-class inserts for high precision threading.

### VP15TF (G-class ground inserts, M-class inserts with 3-D chipbreakers)

#### ● Wide versatility

- High fracture resistance during low rigidity applications such as bar feed machining. Able to withstand harsh conditions for long periods where conventional inserts would be liable to breakage.
- Effective combination of high cost performance M-class inserts with 3-D chipbreakers.

### VP20RT (M-class inserts with 3-D chipbreakers)

#### ● Excellent fracture resistance

- Suitable for stainless steel boring and unstable machining where inserts are vulnerable to fracturing.
- Effective combination of high cost performance M-class inserts with 3-D chipbreakers.

## ■ CHOOSING M-CLASS INSERTS WITH 3-D CHIPBREAKERS OR G-CLASS INSERTS

| Insert                                                                                                                       | Chip control | Precision of thread |
|------------------------------------------------------------------------------------------------------------------------------|--------------|---------------------|
| M-class inserts with 3-D chipbreakers<br> | ◎            | ○                   |

| Insert                                                                                                 | Chip control | Precision of thread |
|--------------------------------------------------------------------------------------------------------|--------------|---------------------|
| G-class inserts<br> | ○            | ◎                   |

- For ideal chip control and a high cost performance ratio, M-class inserts with 3-D chipbreakers are recommended.
- G-class inserts are recommended where higher precision is required.

# CUTTING CONDITIONS OF MMT SERIES

## SELECTING A SHIM FOR THE MMT SERIES

### FLANK ANGLE AND LEAD ANGLE

Lead angle ( $\alpha$ ) depends on a combination of thread diameter and pitch. Select a shim so that the lead angle of the thread can coincide with the flank angles of the thread and insert ( $\beta_1, \beta_2$ ). No need to change a shim for general threading with an MMT holder. When threading with a small diameter or large pitch, change the shim depending on the lead angle, referring to the table and graph below. When threading left hand threads, change to a shim with a negative inclination angle.

### SHIM REFERENCE TABLE (THREADING DIAMETER) (Thread angle 60° and 55°)

| Lead Angle<br>Pitch (mm) | Right Hand Thread (mm) |                                   |                                   |                                   |                                   |                       | Left Hand Thread (mm) * |                                   |                       |

\* Back turning in the case of left hand threads.

When replacing a shim, check if the difference between the thread lead angle and shim inclination angle is within:

2.5° – 0.5° where thread helix angle is 60° (55°)

2° – 1° where thread helix angle is 30° (29°)

\* Inclination angle of a standard shim is 0°.

\* The holder has a 1.5° lead angle.

## CALCULATION OF THREAD LEAD ANGLE

$$\tan \alpha = \frac{l}{\pi d} = \frac{nP}{\pi d}$$

$\alpha$  : Lead angle

$l$  : Lead

$n$  : Number of threads

$P$  : Pitch

$d$  : Effective diameter of thread

## EXAMPLE OF SELECTING A SHIM

- When the thread lead angle is 2.2°

① In the case when the thread helix angle is 60°

(2.2° lead angle) – (2.5° – 0.5°) = -0.3° – 1.7° shim inclination angle is appropriate.

Threading with a standard shim (0° inclination angle) is possible. But, replacing with a shim with a 1° inclination angle is recommended, refer to the Standard Shim List on pages G019 and G026.

② In the case when the thread helix angle is 30°

(2.2° lead angle) – (2° – 1°) = -0.2° – 1.2° shim inclination angle is appropriate.

Replacing with a shim with a 1° inclination angle is recommended, referring to the Standard Shim List on pages G019 and G026.

## RELIEF ANGLE OF AN INSERT SET ON A HOLDER

| Thread Helix Angle | Internal Relief Angle | External Relief Angle |
|--------------------|-----------------------|-----------------------|
| 60°                | 8.8°                  | 5.8°                  |
| 55°                | 7.9°                  | 5.2°                  |
| 30°                | 4.1°                  | 2.7°                  |
| 29°                | 4°                    | 2.6°                  |

- Relief angles ( $\beta_2$ ,  $\beta_1$ ) of an insert become small when the thread helix angle of a trapezoidal, round, or other thread is small. Take care when selecting a shim.

Note 1) • Set the finishing allowance on a diameter at approx. 0.1mm when using a full form insert.

- Please note the cutting depth and the number of passes when a corner radius of a partial form insert or of an internal threading insert is small to prevent damage to the insert corner.
- Please set the cutting depth sufficiently deep enough on materials such as hardened steel or austenitic stainless steel to help prevent premature wear and chipping caused by the outer layer of the material.

Note 1) • Set the finishing allowance on a diameter at approx. 0.1mm when using a full form insert.

- Please note the cutting depth and the number of passes when a corner radius of a partial form insert or of an internal threading insert is small to prevent damage to the insert corner.
- Please set the cutting depth sufficiently deep enough on materials such as hardened steel or austenitic stainless steel to help prevent premature wear and chipping caused by the outer layer of the material.

# THREADING

Note 1) • Set the finishing allowance on a diameter at approx. 0.1mm when using a full form insert.

- Please note the cutting depth and the number of passes when a corner radius of a partial form insert or of an internal threading insert is small to prevent damage to the insert corner.
- Please set the cutting depth sufficiently deep enough on materials such as hardened steel or austenitic stainless steel to help prevent premature wear and chipping caused by the outer layer of the material.

Note 1) • Set the finishing allowance on a diameter at approx. 0.1mm when using a full form insert.

- Please note the cutting depth and the number of passes when a corner radius of a partial form insert or of an internal threading insert is small to prevent damage to the insert corner.
- Please set the cutting depth sufficiently deep enough on materials such as hardened steel or austenitic stainless steel to help prevent premature wear and chipping caused by the outer layer of the material.

# EXTERNAL THREADING

## MMTE HOLDER

- Various insert types.
- Precision class insert.
- Available with a wiper cutting edge to provide a precise thread geometry.
- Able to change lead angle by replacing the shim.

### MMTE

External threading

Details of position A  
Refer to page G020—G023,  
for size PDX, PDY.

Right hand tool holder only.

THREADING

# EXTERNAL THREADING

## MT HOLDER

- Clamp-on type.
- Positive insert suffers from negligible chattering and thus produces good finished surfaces.
- Thread pitch  $\leq 4.5\text{mm}$ .

### External threading

Right hand tool holder shown.

Note 1) Cutting in the opposite direction is not possible.

### STANDARD OF DEPTH OF CUT

- The chart on the right shows the cutting depths when machining external ISO metric screw threads.
- When using cermet grades or cutting stainless steel, please increase the number of passes by 2–3 times.

### METRIC SCREW THREAD

|                   | 14 |      |      |      |      |      |      |      |      |      |      | 0.06 |

Note 1) The first pass causes a high load on the cutting edge.  
In order to avoid damage, keep the depth of cut to 0.4–0.5mm maximum.

# INTERNAL THREADING

## MMTI TYPE BORING BARS

- Minimum cutting diameter 13mm.
- Various insert types.
- Precision class insert.
- Available with a wiper cutting edge to provide a precise thread geometry.
- Able to change lead angle by replacing the shim.

Note 1) Select and use a shim as shown below (sold separately), dependant on the lead angle.

• A screw-on tool holder uses no shim. (The holder body has a lead angle.) Use a tool holder with the appropriate lead angle.

• Min. cutting diameter (DMIN) shows the internal hole diameter, not the thread diameter.

\* Clamp Torque (N · m) : TS25=1.0, CS350860T=3.5, SETS51=3.5, TS43=3.5, SETS61=5.0, HFC03006=1.5, HFC04008=2.2

## RECOMMENDED CUTTING CONDITIONS

|   | Material                    | Cutting Speed (m/min) | Recommended Tool Overhang (mm) |
|---|-----------------------------|-----------------------|--------------------------------|
| P | Carbon Steel<br>Alloy Steel | 50 (30—80)            |                                |
| M | Stainless Steel             | 50 (30—80)            |                                |
| K | Cast Iron                   | 50 (30—80)            |                                |
| N | Non-Ferrous Metal           | 80 (50—100)           |                                |
| S | Heat-Resistant Alloy        | 40 (30—60)            |                                |

(Note 1) Wet cutting is recommended.  
(Note 2) Pay special attention to machining of small diameters at high revolutions as the feed rate cannot keep up with the speed.

## STANDARD OF DEPTH OF CUT

● The chart on the right shows the cutting depths when machining external ISO metric screw threads.

### ● Metric

| P (Pitch)           |    | (mm) |      |      |      |      |      |

# INTERNAL THREADING

## ■ PRECAUTIONS WHEN USING THE MICRO-MINI TWIN

● When using a holder for general purpose / small automatic lathe:

- ① To avoid chipping of the 2nd cutting edge take care when inserting the boring bar into the holder. Refer to fig.1. If the 2nd edge contacts the internal face of the holder there is a possibility that it may chip.

- ② When using this type of holder, there is a possibility that damage to the shank and the 2nd cutting edge can occur. Make sure that the clamping screws are tightened to the set torque value. Additionally make sure that there is no clamping screw near the 2nd cutting edge as this can break the boring bar.

◎ When using Mitsubishi Materials holders

- When using holders with a tool overhang of recommended quantity, ensure that the 3rd clamping screw is removed prior to machining. The set torque value for the clamping screw is 2.0 N • m.

● When using a square type holder:

- ① When installing the boring bar into the holder, tighten the clamp screws after ensuring the flats on the tool holder are parallel to the reference flats on the micro-mini bar. Refer to fig.3.  
② Make sure that the clamping screws are tightened to the recommended values.  
③ Do not tighten the clamp screw without a bar in place, otherwise the bridge will be deformed.

This image shows a blank sheet of white paper designed as a memo template. At the top left, the word "Memo" is printed in a bold, black, sans-serif font. A thick horizontal line runs across the page just below the title. The rest of the page is filled with horizontal dashed lines, providing space for writing. The lines are evenly spaced and extend across the width of the page.

# HOW TO READ THE STANDARD OF HSK-T TOOLS

## ●How this section page is organised

- ①Organised by product series.  
(Refer to the index on the next page.)

FIGURE SHOWING THE TOOLING APPLICATION  
Uses illustrations and arrows to depict available machining applications along with cutting edge lead angles.

### PRODUCT TYPE

Tooling system  
for turning on  
multi-task machines

# HSK TOOLS

## HSK-T System

HSK-T is a new type of HSK system designed for turning on multi-task machines that are compatible with HSK-A type (ISO standard: ISO12164-1:2001). The HSK system was developed by a consortium of 17 Japanese manufacturers and registered in ISO standard (ISO12164-3:2008) under the name HSK-T type in 2008 and JIS standard (JIS B6064-3) in 2013.

## High accuracy cutting edge positioning

The HSK-T type has a closer tolerance between the spindle key and tool holder keyway than the HSK-A type. This results in higher cutting edge positional accuracy. For milling, the conventional HSK-A type tools can be still used.

## Compatible with both multi-task machines and machining centres

HSK-T  
Turning tool holder

HSK-T spindle  
Multi-task machines

HSK-A  
Rotating tool holder

HSK-A spindle  
Machining centre

### \*Note

Short neck length from the flange with thick body of the HSK-T turning tool as shown in the figure at the left. Because there are machines which cannot be mounted depending on the ATC specifications of the multi-task machine (HSK-A type), please check beforehand. Also be careful of interference in the magazine with adjacent tools.

Neck length  
HSK-T63 Min.4mm  
HSK-T100 Min.5mm

Neck thickness  
HSK-T63 Max.62mm  
HSK-T100 Max.99mm

HSK-T turning tool standard (Example)

## Improved keyway tolerance

Tolerance comparison (Example) (mm)

|         | 12.2                    | 12.3 | 12.4 | 12.5 | 12.6 |
|---------|-------------------------|------|------|------|------|
| HSK A63 | Key tolerance 0.10      |      |      |      |      |
|         | Minimum clearance 0.15  |      |      |      |      |
|         | Maximum clearance 0.33  |      |      |      |      |
|         | Keyway tolerance 12.5   |      |      |      |      |
| HSK T63 | Key tolerance 0.025     |      |      |      |      |
|         | Minimum clearance 0.015 |      |      |      |      |
|         | Maximum clearance 0.075 |      |      |      |      |
|         | Keyway tolerance 12.46  |      |      |      |      |

# High accuracy and rigidity HSK-T type tooling system developed for use on multi-task machines.

## Straight type tools suitable for use on multi-task machines

Avoid workpiece interference with improved tool accessibility.

By tilting the machines B spindle (main axis of the tool) at 45 deg, interference between the spindle, holder, workpiece and chuck can be avoided.

Improve centreline height by positioning the cutting edge at the centre of the spindle.

Increased stability and accuracy can be achieved because the cutting edge centreline height is not affected by the gap between the spindle and the key.

## New one-action type double clamp series

The double clamp mechanism offers high rigidity, accuracy and reliability for secure insert clamping. Making it suitable for difficult to machine materials such as stainless and heat resistant alloys.

Handed type for turning and facing

Straight type for turning and facing

For turning, facing and boring

## 3 on 1 tool for process and tool consolidation

3 turning inserts of the same geometry can be installed on a single tool.

The same type of inserts can be installed for quick tool changes.

Different types of inserts can be installed for different applications (roughing, semi finishing and finishing)

Different grade inserts can be installed to cover various types of workpieces.

## New HSK-T100 size for large workpieces

Larger tool holder sizes for high efficiency machining.

Square shank holder type

Boring bar / Drill type

Sleeve

**A single tool can be used with different sized tool holders.**

- Available for use with JIS B4126 (ISO 5610) 32 x 32 and 32 x 25 tools.
- Possible to fit a 25 x 25 tool by using a 7mm plate.
- \*Plate not supplied.

\* The tools marked \* in the table cannot be fitted on the Yamazaki Mazak INTEGREX i, j series.

\*1 Clamp Torque (N • m) : LLC108=3.3

\*2 Please use shim no. LLSDN42 with 6.35mm thick inserts. When using 6.35mm thick inserts, the shim should be ordered separately.

\*3 WT : Tool Weight

Note 1) Dimensions shown for insert corner RE 0.8.

## STANDARD OF DEPTH OF CUT ● METRIC SCREW THREAD

Unit : mm

- The chart on the right shows the cutting depths when machining external ISO metric screw threads.
- When using cermet grades or cutting stainless steel, please increase the number of passes by 2—3 times.

| P (Pitch)        |    | 0.75 | 1.00 | 1.25 | 1.50 | 1.75 | 2.00 | 2.50 | 3.00 | 3.50 | 4.00 | 4.50 |

Note 1) The first pass causes a high load on the cutting edge.  
In order to avoid damage, restrict the depth of cut to a maximum of 0.4—0.5mm.

### Cutting speed and chip control range of chipbreaker

In general, when cutting speed increases, the chip control range tends to become narrower.

Workpiece : DIN Ck45(180HB) Tool : MTJNR2525M16N  
Insert : TNMG160408 Dry Cutting  
Grade : P10Cemented Carbide

### Effects of coolant on the chip control range of a chipbreaker

If the cutting speed is the same, the range of chip control differs according to whether coolant is used or not.

Workpiece : DIN Ck45  
Cutting Conditions :  $V_c = 100\text{m/min}$

# EFFECTS OF CUTTING CONDITIONS FOR TURNING

## ■ EFFECTS OF CUTTING CONDITIONS

Ideal conditions for cutting are short cutting time, long tool life and high cutting accuracy. In order to obtain these conditions, a selection of efficient cutting conditions and tools, based on work material, hardness, shape and machine capability is necessary.

## ■ CUTTING SPEED

Cutting speed has severe impact on tool life. Increasing cutting speed increases cutting temperature and results in a shortened tool life. Cutting speed varies depending on the type and hardness of the material. Selecting a tool grade suitable for the cutting speed is necessary.

## ● Effects of Cutting Speed

1. Increasing cutting speed by 20% decreases tool life by 50%. Increasing cutting speed by 50% decreases tool life by 80%.
2. Cutting at low cutting speed (20–40m/min) tends to cause chattering. Thus, tool life is shortened.

## EFFECTS OF CUTTING CONDITIONS FOR TURNING

### ■ FEED

When cutting with a general holder, feed is the distance a holder moves per workpiece revolution. In milling, feed is the distance a machine table moves per cutter revolution divided by the number of inserts. Thus, it is indicated as feed per tooth. Feed rate relates to finished surface roughness.

#### ● Effects of Feed

1. Decreasing feed rate results in flank wear and shortens tool life.
2. Increasing feed rate increases cutting temperature and flank wear. However, effects on the tool life is minimal compared to cutting speed.
3. Increasing feed rate improves machining efficiency.

### ■ DEPTH OF CUT

Depth of cut is determined according to the required stock removal, shape of workpiece, power and rigidity of the machine and tool rigidity.

#### ● Effects of Depth of Cut

1. Changing depth of cut doesn't effect tool life greatly.
2. Small depths of cut result in friction when cutting the hardened layer of a workpiece. Thus tool life is shortened.
3. When cutting uncut surfaces or cast iron surfaces, the depth of cut needs to be increased as much as the machine power allows in order to avoid cutting the impure hard surface layer with the tip of cutting edge and therefore prevent chipping and abnormal wear.

# FUNCTION OF TOOL FEATURES FOR TURNING

## RAKE ANGLE

Rake angle is the cutting edge angle that has a large effect on cutting resistance, chip disposal, cutting temperature and tool life.

## Effects of Rake Angle

1. Increasing rake angle in the positive (+) direction improves sharpness.
2. Increasing rake angle by  $1^\circ$  in the positive (+) direction decreases cutting power by about 1%.
3. Increasing rake angle in the positive (+) direction lowers cutting edge strength and in the negative (-) direction increases cutting resistance.

### When to Increase Rake Angle in the Negative (-) Direction

- ☐ Hard workpiece.
- ☐ When cutting edge strength is required such as in interrupted cutting and uncut surface cutting.

### When to Increase Rake Angle in the Positive (+) Direction

- ☐ Soft workpiece.
- ☐ Workpiece is easily machined.
- ☐ When the workpiece or the machine have poor rigidity.

## FLANK ANGLE

Flank angle prevents friction between the flank face and workpiece resulting in a smooth feed.

## Effects of Flank Angle

1. Increasing flank angle decreases flank wear occurrence.
2. Increasing flank angle lowers cutting edge strength.

### When to Decrease Flank Angle

- ☐ Hard workpieces.
- ☐ When cutting edge strength is required.

### When to Increase Flank Angle

- ☐ Soft workpieces.
- ☐ Workpieces suffer easily from work hardening.

# FUNCTION OF TOOL FEATURES FOR TURNING

## ■ SIDE CUTTING EDGE ANGLE (LEAD ANGLE)

Side cutting edge angle and corner angle lower impact load and effect feed force, back force and chip thickness.

### ● Effects of Side Cutting Edge Angle (Lead Angle)

1. At the same feed rate, increasing the side cutting edge angle increases the chip contact length and decreases chip thickness. As a result, the cutting force is dispersed on a longer cutting edge and tool life is prolonged. (Refer to the chart.)
2. Increasing the side cutting edge angle increases force  $a'$ . Thus, thin, long workpieces can suffer from bending.
3. Increasing the side cutting edge angle decreases chip control.
4. Increasing the side cutting edge angle decreases the chip thickness and increases chip width. Thus, breaking the chips is difficult.

#### When to Decrease Lead Angle

- Finishing with a small depth of cut.
- Thin, long workpieces.
- When the machine has poor rigidity.

#### When to Increase Lead Angle

- Hard workpieces which produce high cutting temperature.
- When roughing a large diameter workpiece.
- When the machine has high rigidity.

## ■ END CUTTING EDGE ANGLE

The end cutting edge angle avoids interference between the machined surface and the tool (end cutting edge). Usually  $5^\circ - 15^\circ$ .

### ● Effects of End Cutting Edge Angle

1. Decreasing the end cutting edge angle increases cutting edge strength, but it also increases cutting edge temperature.
2. Decreasing the end cutting edge angle increases the back force and can result in chattering and vibration while machining.
3. Small end cutting edge angle for roughing and a large angle when finishing are recommended.

## ■ CUTTING EDGE INCLINATION

Cutting edge inclination indicates inclination of the rake face. When heavy cutting, the cutting edge receives an extremely large shock at the beginning of cutting. Cutting edge inclination keeps the cutting edge from receiving this shock and prevents fracturing.  $3^\circ - 5^\circ$  in turning and  $10^\circ - 15^\circ$  in milling are recommended.

### ● Effects of Cutting Edge Inclination

1. Negative (-) cutting edge inclination disposes chips in the workpiece direction, and positive (+) disposes chips in the opposite direction.
2. Negative (-) cutting edge inclination increases cutting edge strength, but it also increases back force of cutting resistance. Thus, chattering easily occurs.

## ■ HONING AND LAND

Honing and land are cutting edge shapes that maintain cutting edge strength.

Honing can be round or chamfer type. The optimal honing width is approximately 1/2 of the feed.

Land is the narrow flat area on the rake or flank face.

Workpiece : Alloy steel (280HB)  
Grade : P10  
Cutting Conditions :  $V_c=200\text{m/min}$   $a_p=1.5\text{mm}$   
 $f=0.335\text{mm/rev}$

**Honing Size and Tool Life  
Due to Fracturing**

Workpiece : Alloy steel (220HB)  
Grade : P10  
Cutting Conditions :  $V_c=160\text{m/min}$   $a_p=1.5\text{mm}$   
 $f=0.45\text{mm/rev}$

**Honing Size and Tool Life  
Due to Wear**

Workpiece : Alloy steel (220HB)  
Grade : P10  
Cutting Conditions :  $V_c=100\text{m/min}$   $a_p=1.5\text{mm}$   
 $f=0.425\text{mm/rev}$

**Honing Size and Cutting Resistance**

## ● Effects of Honing

1. Enlarging the honing increases cutting edge strength, tool life and reduces fracturing.
2. Enlarging the honing increases flank wear occurrence and shortens tool life. Honing size doesn't affect rake wear.
3. Enlarging the honing increases cutting resistance and chattering.

### When to Decrease Honing Size

- When finishing with a small depth of cut and small feed.
- Soft workpieces.
- When the workpiece and the machine have poor rigidity.

### When to Increase Honing Size

- Hard workpieces.
- When cutting edge strength is required for uncut surfaces and interrupted cutting.
- When the machine has high rigidity.

Note 1) Cemented carbide, UTi, coated diamond and indexable cermet inserts have round honing as standard already.

# FUNCTION OF TOOL FEATURES FOR TURNING

## ■ RADIUS

Radius effects the cutting edge strength and finished surface. In general, a corner radius 2–3 times the feed is recommended.

## ● Effects of Corner Radius

1. Increasing the corner radius improves the surface finish.
2. Increasing the corner radius improves cutting edge strength.
3. Increasing the corner radius too much increases the cutting resistance and causes chattering.
4. Increasing the corner radius decreases flank and rake wear.
5. Increasing the corner radius too much results in poor chip control.

### When to Decrease Corner Radius

- Finishing with small depth of cut.
- Thin, long workpieces.
- When the machine has poor rigidity.

### When to Increase Corner Radius

- When cutting edge strength is required for interrupted cutting and uncut surface cutting.
- When roughing a workpiece with a large diameter.
- When the machine has high rigidity.

## ● Corner Radius and Chip Control Range

Note 1) Please refer to page P008 for chip shapes (A, B, C, D, E).

# FORMULAE FOR CUTTING POWER

## ■ CUTTING POWER (Pc)

$$P_c = \frac{a_p \cdot f \cdot V_c \cdot K_c}{60 \times 10^3 \times \eta} \text{ (kW)}$$

**P<sub>c</sub> (kW)** : Actual Cutting Power  
**f (mm/rev)** : Feed per Revolution  
**K<sub>c</sub> (MPa)** : Specific Cutting Force

**a<sub>p</sub> (mm)** : Depth of Cut  
**V<sub>c</sub> (m/min)** : Cutting Speed  
**η** : (Machine Coefficient)

(Example) What is the cutting power required for machining mild steel at cutting speed 120m/min with depth of cut 3mm and feed 0.2mm/rev (Machine coefficient 80%) ?  
 (Answer) Substitute the specific cutting force K<sub>c</sub>=3100MPa into the formula.

$$P_c = \frac{3 \times 0.2 \times 120 \times 3100}{60 \times 10^3 \times 0.8} = 4.65 \text{ (kW)}$$

### ● K<sub>c</sub>

| Material                       | Tensile Strength(MPa) and Hardness | Specific Cutting Force K <sub>c</sub> (MPa) |              |              |              |              |
|--------------------------------|------------------------------------|---------------------------------------------|--------------|--------------|--------------|--------------|
|                                |                                    | 0.1 (mm/rev)                                | 0.2 (mm/rev) | 0.3 (mm/rev) | 0.4 (mm/rev) | 0.6 (mm/rev) |
| Mild Steel                     | 520                                | 3610                                        | 3100         | 2720         | 2500         | 2280         |
| Medium Steel                   | 620                                | 3080                                        | 2700         | 2570         | 2450         | 2300         |
| Hard Steel                     | 720                                | 4050                                        | 3600         | 3250         | 2950         | 2640         |
| Tool Steel                     | 670                                | 3040                                        | 2800         | 2630         | 2500         | 2400         |
| Tool Steel                     | 770                                | 3150                                        | 2850         | 2620         | 2450         | 2340         |
| Chrome Manganese Steel         | 770                                | 3830                                        | 3250         | 2900         | 2650         | 2400         |
| Chrome Manganese Steel         | 630                                | 4510                                        | 3900         | 3240         | 2900         | 2630         |

| Grey Cast Iron                 | 200HB                              | 2110                                        | 1800         | 1600         | 1400         | 1330         |

## ■ CUTTING SPEED (V<sub>c</sub>)

$$V_c = \frac{\pi \cdot D_m \cdot n}{1000} \text{ (m/min)}$$

**V<sub>c</sub> (m/min)** : Cutting Speed  
**D<sub>m</sub> (mm)** : Workpiece Diameter  
**π (3.14)** : Pi  
**n (min<sup>-1</sup>)** : Main Axis Spindle Speed

\*Divide by 1000 to change to m from mm.

(Example) What is the cutting speed when main axis spindle speed is 700min<sup>-1</sup> and external diameter is φ50 ?

(Answer) Substitute π=3.14, D<sub>m</sub>=50, n=700 into the formula.

$$V_c = \frac{\pi \cdot D_m \cdot n}{1000} = \frac{3.14 \times 50 \times 700}{1000} = 110 \text{ m/min}$$

Cutting speed is 110m/min.

## ■ FEED (f)

$$f = \frac{l}{n} \text{ (mm/rev)}$$

**f (mm/rev)** : Feed per Revolution  
**l (mm/min)** : Cutting Length per Min.  
**n (min<sup>-1</sup>)** : Main Axis Spindle Speed

(Example) What is the feed per revolution when main axis spindle speed is 500min<sup>-1</sup> and cutting length per minute is 120mm/min ?

(Answer) Substitute n=500, l=120 into the formula.

$$f = \frac{l}{n} = \frac{120}{500} = 0.24 \text{ mm/rev}$$

The answer is 0.24mm/rev.

## ■ CUTTING TIME (T<sub>c</sub>)

$$T_c = \frac{l_m}{f} \text{ (min)}$$

**T<sub>c</sub> (min)** : Cutting Time  
**l<sub>m</sub> (mm)** : Workpiece Length  
**f (mm/min)** : Cutting Length per Min.

(Example) What is the cutting time when 100mm workpiece is machined at 1000min<sup>-1</sup> with feed = 0.2mm/rev ?

(Answer) First, calculate the cutting length per min. from the feed and spindle speed.

$$l = f \times n = 0.2 \times 1000 = 200 \text{ mm/min}$$

Substitute the answer above into the formula.

$$T_c = \frac{l_m}{f} = \frac{100}{200} = 0.5 \text{ min}$$

0.5 x 60=30 (sec.) The answer is 30 sec.

## ■ THEORETICAL FINISHED SURFACE ROUGHNESS (h)

$$h = \frac{f^2}{8RE} \times 1000 (\mu\text{m})$$

**h (μm)** : Finished Surface Roughness  
**f (mm/rev)** : Feed per Revolution  
**RE (mm)** : Insert Corner Radius

(Example) What is the theoretical finished surface roughness when the insert corner radius is 0.8mm and feed is 0.2mm/rev ?

(Answer) Substitute f=0.2mm/rev, RE=0.8 into the formula.

$$h = \frac{0.2^2}{8 \times 0.8} \times 1000 = 6.25 \mu\text{m}$$

The theoretical finished surface roughness is 6μm.

# TROUBLE SHOOTING FOR THREADING

| Problems              | Observation                                                       | Causes                                                                      | Solutions                                                                                            |
|-----------------------|-------------------------------------------------------------------|-----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| Low thread precision. | Threads do not mesh with each other.                              | Incorrect tool installation.                                                | Set the insert centre height at 0mm.                                                                 |
|                       |                                                                   |                                                                             | Check holder inclination (Lateral).                                                                  |
|                       | Shallow thread.                                                   | Incorrect depth of cut.                                                     | Modify the depth of cut.                                                                             |
|                       |                                                                   | Lack of insert wear or plastic deformation resistance.                      | Refer to "Quickly generated flank wear." and "Large plastic deformation." below.                     |
| Poor surface finish.  | Surface damage.                                                   | Chips wrap around or clog the work pieces.                                  | Change to flank infeed and control the chip discharge direction.                                     |
|                       |                                                                   |                                                                             | Change to an M-class insert with a 3-D chipbreaker.                                                  |
|                       |                                                                   | The side of the insert cutting edge interferes with the workpiece.          | Check the lead angle and select an appropriate shim.                                                 |
|                       | Surface tears.                                                    | Built-up edge (Welding).                                                    | Increase cutting speed.                                                                              |
|                       |                                                                   |                                                                             | Increase coolant pressure and volume.                                                                |
|                       |                                                                   | Cutting resistance too high.                                                | Decrease depth of cut per pass.                                                                      |
|                       | Surface vibrations.                                               | Cutting speed too high.                                                     | Decrease the cutting speed.                                                                          |
|                       |                                                                   | Insufficient work piece or tool clamping.                                   | Re-check work piece and tool clamping. (Chuck pressure, clamping allowance)                          |
|                       |                                                                   | Incorrect tool installation.                                                | Set the insert centre height at 0 mm.                                                                |
| Short tool life.      | Flank wear quickly generated.                                     | Cutting speed too high.                                                     | Decrease the cutting speed.                                                                          |
|                       |                                                                   | Too many passes causes abrasive wear.                                       | Reduce the number of passes.                                                                         |
|                       |                                                                   | Small depth of cut for the finishing pass.                                  | Do not re-cut at 0mm depth of cut, larger than 0.05mm depth of cut is recommended.                   |
|                       | Non-uniform wear of the right and left sides of the cutting edge. | The work piece lead angle and the tool lead angle do not match.             | Check the work piece lead angle and select an appropriate shim.                                      |
|                       | Chipping and fracture.                                            | Cutting speed too low.                                                      | Increase cutting speed.                                                                              |
|                       |                                                                   | Cutting resistance too high.                                                | Increase the number of passes and decrease the cutting resistance per pass.                          |
|                       |                                                                   | Unstable clamping.                                                          | Check work piece deflection.                                                                         |
|                       |                                                                   |                                                                             | Shorten tool overhang.                                                                               |
|                       |                                                                   |                                                                             | Re-check work piece and tool clamping. (Chuck pressure, clamping allowance)                          |
|                       |                                                                   | Chip packing.                                                               | Increase coolant pressure to blow away chips.                                                        |
|                       |                                                                   |                                                                             | Change the tool pass to control chips. (Lengthen each pass to allow the coolant to clear the chips.) |
|                       |                                                                   |                                                                             | Change from standard internal cutting to back turning to prevent chip jamming.                       |
|                       |                                                                   | Non-chamfered work pieces causes high resistance at the start of each pass. | Chamfer the workpiece entry and exit faces.                                                          |
|                       | Large plastic deformation.                                        | High cutting speed and large heat generation.                               | Decrease the cutting speed.                                                                          |
|                       |                                                                   | Lack of coolant supply.                                                     | Check coolant supply is sufficient.                                                                  |
|                       |                                                                   |                                                                             | Increase coolant pressure and volume.                                                                |
|                       |                                                                   | Cutting resistance too high.                                                | Increase the number of passes and decrease the cutting resistance per pass.                          |

# THREADING METHODS

## THREADING METHODS

|          | Right Hand Thread                                                                                        | Left Hand Thread                                                                                           |

|                                                                                                              | Advantages                                                                                                                                                                                                                                                                                           | Disadvantages                                                                                                                                                                                        |
|  <p>Fixed cut area</p>      | <ul style="list-style-type: none"> <li>● Easy to use. (Standard programme for threading.)</li> <li>● Superior resistance to vibration. (Constant cutting force.)</li> </ul>                                                                                                                          | <ul style="list-style-type: none"> <li>● Long chips generated during the final pass.</li> <li>● Complex calculation of cutting depth when changing the number of passes.</li> </ul>                  |
|  <p>Fixed cutting depth</p> | <ul style="list-style-type: none"> <li>● Reduced load on nose radius during the first half of the passes.</li> <li>● Easy chip control. (Optional setting of chip thickness)</li> <li>● Easy to calculate cutting depth when changing the number of passes.</li> <li>● Good chip control.</li> </ul> | <ul style="list-style-type: none"> <li>● Subject to vibration in the later stages of cutting. (Increased cutting force)</li> <li>● In some cases, changing the NC programme is necessary.</li> </ul> |

Note 1) It is recommended to set the depth of cut of the final pass to 0.05mm–0.025mm.  
Large cutting depths can cause vibration, leading to a poor surface finish.

## ■ FORMULAE

### ● Formulae to calculate infeed for each pass in a reduced series.

Note 1) Tool life and surface finish accuracy can be increased by changing the threading method from flank infeed to modified flank infeed.  
Chip control can be improved by increasing the cutting depth in the later half of passes.

## CUTTING DEPTH AND THE NUMBER OF PASSES

- **Selection of the appropriate cutting depth and the right number of passes is vital for threading.**
  - For most threading, use a "threading cycle program," which has originally been installed on machines, and specify "total cutting depth" and "cutting depth in the first or final pass."
  - Cutting depth and the number of passes are easy to change for the radial infeed method, thus making it easy to determine the appropriate cutting conditions.

## FEATURES AND BENEFITS OF MITSUBISHI MATERIALS PRODUCTS

- Insert grades with high wear and plastic deformation resistance, specially produced for threading tools, ensure highly efficient cutting by enabling high-speed machining and a reduced number of passes.

**Machining Cost Reduction**

## ADVICE ON IMPROVED THREADING

- **Increasing tool life**
  - To prevent damage to the nose radius - Recommended method - Modified flank infeed
  - To have uniform flank wear on both sides of a cutting edge - Recommended method - Radial infeed
  - To prevent crater wear - Recommended method - Flank infeed
- **Preventing chip problems**
  - Change to flank or modified infeed.
  - During radial infeed cutting, use an inverted holder and change the coolant supply to a downward direction.
  - When using the radial infeed method, set the minimum cutting depth at around 0.2mm to make the chips thicker.
- **To achieve highly efficient machining**
  - Increase cutting speed. (Dependant on the maximum revolution and rigidity of the machine.)
  - Reduce the number of passes. (Reduce by 30-40%.)
  - A reduced number of passes can improve chip discharge because of the thicker chips generated.
- **Preventing vibration**
  - Change to flank or modified infeed.
  - When using radial infeed, reduce cutting depth in the later half of passes and lower the cutting speed.
- **Increased surface finish accuracy**
  - A final wiping pass should be performed at the same depth of cut as the last regular pass.
  - When using the flank infeed method, change to radial infeed only during the final pass.

## SURFACE ROUGHNESS

(From JIS B 0601-1994)

| Type                        | Code  | Determination                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Determination Example (Figure)                                                                                                                                                                                                                                                                                                                      |
|-----------------------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Arithmetical Mean Roughness | Ra    | <p>Ra means the value obtained by the following formula and expressed in micrometer (<math>\mu\text{m}</math>) when sampling only the reference length from the roughness curve in the direction of the mean line, taking X-axis in the direction of mean line and Y-axis in the direction of longitudinal magnification of this sampled part and the roughness curve is expressed by <math>y=f(x)</math>:</p> $Ra = \frac{1}{l} \int_0^l  f(x)  dx$                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                     |
| Maximum Height              | Rz    | <p>Rz shall be that only when the reference length is sampled from the roughness curve in the direction of the mean line, the distance between the top profile peak line and the bottom profile valley line on this sampled portion is measured in the longitudinal magnification direction of roughness curve and the obtained value is expressed in micrometer (<math>\mu\text{m}</math>).</p> <p>Note: When finding Rz, a portion without an exceptionally high peak or low valley, which may be regarded as a flaw, is selected as the sampling length.</p> $Rz = R_p + R_v$ |                                                                                                                                                                                                                                                                                                                                                     |
| Ten-Point Mean Roughness    | RzJIS | <p>RzJIS shall be that only when the reference length is sampled from the roughness curve in the direction of its mean line, the sum of the average value of absolute values of the heights of five highest profile peaks (Yp) and the depths of five deepest profile valleys (Yv) measured in the vertical magnification direction from the mean line of this sampled portion and this sum is expressed in micrometer (<math>\mu\text{m}</math>).</p> $RzJIS = \frac{(Y_{p1} + Y_{p2} + Y_{p3} + Y_{p4} + Y_{p5}) + (Y_{v1} + Y_{v2} + Y_{v3} + Y_{v4} + Y_{v5})}{5}$           | <p><math>Y_{p1}, Y_{p2}, Y_{p3}, Y_{p4}, Y_{p5}</math> : altitudes of the five highest profile peaks of the sampled portion corresponding to the reference length l.</p> <p><math>Y_{v1}, Y_{v2}, Y_{v3}, Y_{v4}, Y_{v5}</math> : altitudes of the five deepest profile valleys of the sampled portion corresponding to the reference length l.</p> |

## RELATIONSHIP BETWEEN ARITHMETICAL MEAN (Ra) AND CONVENTIONAL DESIGNATION (REFERENCE DATA)

Note 1) The above list is the same as that of AMS Metals Hand book with tensile strength in approximate metric value and Brinell hardness over a recommended range.

Note 2) 1MPa=1N/mm<sup>2</sup>

Note 3) Figures in ( ) are rarely used and are included for reference. This list has been taken from JIS Handbook Steel I.

# FIT TOLERANCE TABLE (HOLE)

| Classification of Standard Dimensions (mm) |     | Class of Geometrical Tolerance Zone of Holes |              |              |              |              |              |              |              |              |             |             |             |            |            |          |          |

# CUTTING TOOL MATERIALS

Cemented carbide (WC-Co) was developed in 1923 and was later improved by adding TiC and TaC. In 1969, CVD coating technology was developed and coated carbide has since been widely used. TiC-TiN based cermet was developed in 1974. Today, "Coated carbide grades for roughing and cermet for finishing" is a well established method.

## GRADE CHARACTERISTICS

| Hard Materials                 | Hardness (HV) | Energy Formation (kcal/g·atom) | Solubility in Iron (%.1250°C) | Thermal Conductivity (W/m·k) | Thermal * Expansion (x 10 <sup>-6</sup> /k) | Tool Material                |

This image shows a full page of a document template designed as a memo or notebook page. At the top left, the word "Memo" is written in a large, bold, black sans-serif font. A thick, solid black horizontal line runs across the entire width of the page directly beneath the title. The remainder of the page is filled with thin, light gray horizontal lines spaced evenly apart, providing a guide for writing. There are no vertical margin lines, bullet points, or other markings present.

# WORLDWIDE

## **MITSUBISHI MATERIALS - METALWORKING SOLUTIONS COMPANY A SYNERGY FOR SUCCESS**

The Metalworking Solutions division of Mitsubishi Materials is dedicated to the development and processing of metals, cutting materials, coatings and precision tools. Profound know-how and many years of experience in manufacturing technology makes Mitsubishi Materials one of the leading suppliers in the precision cutting tool market.

The company's global market presence, with headquarters and sales offices in Japan, Europe, India, Brazil, China, Thailand, Mexico and the US, as well as a broad network of international distributors, ensures a targeted, comprehensive service.

Information exchange and technology transfer, open communication and growing synergies guarantee maximum performance and sustainable customer success.
