

# TURNING TOOLS

# TURNING TOOLS

## **QUALITY – HIGHEST STANDARDS ACROSS PRODUCTS AND SERVICES**

Turning tools from Mitsubishi Materials embody this philosophy and have been convincing the global market for more than 30 years!

Mitsubishi Materials precision tools enrich the metalworking industry with durability, speed and accuracy.

Whether it is a grooving tool, an ISO insert or vibration-damping boring bar, the extensive range of turning tools has performance in mind.

GENERAL INFORMATION

# HOW TO READ THE STANDARD OF TURNING INSERTS

## ●How this section page is organised

- ① Organised according to the insert shape.  
(Refer to the index on the next page.)
- ② Inserts are arranged in order of :
  - Negative inserts (with hole→without hole)
  - Positive inserts (with hole→without hole)
- ③ Chipbreakers are arranged in order of :  
Finish Cutting→Light Cutting→Medium Cutting  
→Rough Cutting→Heavy Cutting

## ●Graph of chip control by material

Shows recommended chipbreakers and chip control range according to the material and cutting application.  
Graphs are coloured according to the applications  
(Finish→Light→Medium→Rough→Heavy)  
and contain recommended chipbreakers for each application.

Finish Cutting : — Light Cutting : — Medium Cutting : —  
Rough Cutting : — Heavy Cutting : —

### GRADE APPLICATION RECOMMENDED FOR EACH MATERIAL

Cutting conditions suitable for each type of material is shown as a general guide to select the grade.

● : Stable Cutting ● : General Cutting ✖ : Unstable Cutting

# TOOL NAVI

## ■ OUTLINE

TOOL NAVI provides information and suitable cutting conditions for each material by selecting the optimum indexable insert together with a suitable tool life expectancy.

## ■ LABEL INDICATION

\*1 Some inserts will have multiple material recommendations.

\*2 Please contact us for recommended cutting conditions when using coefficient values other than above.

## ② Cutting speed standards (Performance versus tool life)

| Material | Tool Life |             | Material                  | Hardness |
|----------|-----------|-------------|---------------------------|----------|
|          | Life      | Performance |                           |          |
| P        | 90min     | 15min       | Carbon steel, alloy steel | 180HB    |
| M        | 90min     | 15min       | Stainless steel           | 180HB    |
| K        | 90min     | 15min       | Cast iron                 | 180HB    |
| S        | 25min     | 5min        | Titanium alloy            | 320HB    |
|          |           |             | Ni, Co-Based alloy        | 400HB    |
| H        | 80min     | 10min       | Hardened steel            | 60HRC    |

\*3 N : Life based on each grade. For stable conditions choose the performance cutting speed, for unstable conditions choose the tool life feed rate.

\*4 The tool life is based on the following (VB wear). Some materials include elements other than this.  
 PMKS ... VB=0.3mm  
 H ... VB=0.1mm

## ■ TOOL LIFE

Cutting speed has a large affect on tool life. TOOL NAVI is based on Taylor's equation (relationship  $V_c T^n = C$  between tool grade, cutting conditions, and tool life). Therefore, performance speed and tool life is found for each material. When a different tool life is required, obtain coefficient values of the grade used from the charts below. Multiply the coefficient values by the cutting speed to calculate a new cutting speed.

### ● P Grade (Steel) cutting speed coefficient values.

| Grade \ Tool life | 15min | 30min | 45min | 60min | 90min |
|-------------------|-------|-------|-------|-------|-------|
| MC6115            | 1.00  | 0.82  | 0.72  | 0.67  | 0.59  |
| MC6125            | 1.00  | 0.83  | 0.75  | 0.69  | 0.62  |
| MP3025            | 1.00  | 0.85  | 0.77  | 0.72  | 0.65  |
| NX2525            | 1.00  | 0.87  | 0.80  | 0.76  | 0.70  |

### ● M Grade (Stainless Steel) cutting speed coefficient values.

| Grade \ Tool life | 15min | 30min | 45min | 60min | 90min |
|-------------------|-------|-------|-------|-------|-------|
| MC7015            | 1.00  | 0.83  | 0.75  | 0.70  | 0.63  |
| MC7025            | 1.00  | 0.90  | 0.84  | 0.80  | 0.75  |
| MP7035            | 1.00  | 0.84  | 0.76  | 0.71  | 0.62  |
| US735             | 1.00  | 0.78  | 0.68  | 0.61  | 0.53  |

## ① Materials

P : Steel (Reference material : Carbon steel, alloy steel 180HB)  
 M : Stainless steel (Reference material : Austenitic stainless steel 180HB)  
 K : Cast iron (Reference material : Gray cast iron, ductile cast iron 180HB)  
 N : Aluminium alloy, non-ferrous metals  
 S : Reference material : Titanium alloy 320HB, Ni, Co-Based alloy 400HB  
 H : Hardened steel 60HRC

## ③ Feed rate standards

Minimum and maximum feed rates shown are based on the chip control range and are dependant on the chipbreaker geometry.

### ● K Grade (Cast Iron) cutting speed coefficient values.

| Grade \ Tool life | 15min | 30min | 45min | 60min | 90min |
|-------------------|-------|-------|-------|-------|-------|
| MC5115            | 1.00  | 0.79  | 0.69  | 0.62  | 0.54  |
| MC5125            | 1.00  | 0.76  | 0.65  | 0.58  | 0.50  |

(ex.) Medium cutting of steel  
 The 1st recommendation : MC6125  
 Indexable inserts : CNMG120408-MP  
 Recommended cutting speed :  $V_c=390\text{m/min}$   
 (Tool life : 15min.)

Tool life required : 30min.

$390 \times 0.83 \approx 323\text{m/min}$

## ■ HARDNESS OF THE MATERIAL

Hardness of the material also affects tool life. Mitsubishi's TOOL NAVI suggests cutting speed variations when material hardness differs. Obtain the suitable coefficient value for each type of material from the chart below. Multiply the coefficient value by the recommended cutting speed of the grade used to calculate a new cutting speed.

| Material | (Hardness of material) |       |       |       |       |       |       |       |       |       |       |       |
|----------|------------------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
|          | 120HB                  | 140HB | 160HB | 180HB | 200HB | 220HB | 240HB | 260HB | 280HB | 300HB | 320HB | 340HB |
| P        | 1.34                   | 1.19  | 1.08  | 1.00  | 0.92  | 0.85  | 0.80  | 0.75  | 0.71  | 0.68  | 0.64  | 0.61  |
| M        | 1.41                   | 1.23  | 1.10  | 1.00  | 0.91  | 0.85  | 0.78  | 0.72  | 0.68  | 0.64  | 0.61  | 0.58  |
| K        | 1.27                   | 1.19  | 1.09  | 1.00  | 0.97  | 0.91  | 0.88  | 0.85  | 0.81  | 0.78  | 0.75  | 0.72  |

## OPTIMUM GRADES AND CHIPBREAKERS FOR EXTERNAL TURNING

### ● Selection of optimum inserts for turning

The following diagrams show for each type of material, the optimal combination of suitable grades and chipbreakers for each application area in turning.

TURNING INSERTS

### ■ CUTTING CONDITIONS

- Stable Cutting  
Continuous Cutting  
Constant Depth of Cut  
Pre-Machined  
Securely Clamped Component Cutting
- General Cutting
- ⊕ Unstable Cutting  
Heavy Interrupted Cutting  
Irregular Depth of Cut  
Low Clamping Rigidity Cutting

### ■ CUTTING AREA

- F** Finish Cutting
- L** Light Cutting
- M** Medium Cutting
- R** Rough Cutting
- H** Heavy Cutting

# WIPER INSERT

## What is a Wiper Insert?

- The wiper insert is designed with a wiper edge that is situated where the straight edge meets the corner radius.
- In comparison to conventional chipbreakers, the surface finish does not deteriorate even if the feed rate is doubled.
- Machining at high feed rates improves cutting efficiency.

## Improving Surface Finish

Under the same machining conditions as conventional chipbreakers, but with the feed rate increased, the surface finish of the material can be improved.

## Improving Efficiency

High feed rates not only shorten machining times but also make it possible to combine roughing and finishing operations.

## Increased Tool Life

When using to high feed conditions, the time required to cut one component is decreased, thus more parts can be machined with each insert. In addition, the high feed rate prevents rubbing, therefore, delaying the progression of wear and increasing the tool life of the insert.

## Improving Chip Control

Under high feed conditions, the chips generated become thicker and are more easily broken, thus, chip control is improved.

## A wiper insert + machining at high feed rate

- Reduced machining time (per workpiece)
- Increased number of workpieces (per definitive time period)
- Improving chip control

## A wiper insert + machining at conventional feed rate

- Eliminating the finishing step by roughing and finishing together (Separate roughing and finishing steps → Single-step machining)

- Reducing cycle times
- Increased productivity
- Avoiding Line-Stoppage

## The Realisation of Reduced Costs!!

## Estimating the finished surface roughness when using a wiper insert

The effects of wiper inserts on external machining, boring and facing.

- The surface roughness when machining at a corner R or taper angle over 5°, is the same as machining with standard inserts.

$$R_z(W) = R_z \times 0.5$$

$R_z(W)$  = Finished surface roughness when using a wiper insert.  
 $R_z$  : Finished surface roughness from conventional conditions. (When using a standard insert)

— Effective usage of a wiper insert  
— Non effective usage of a wiper insert

## Special attention is not necessary when using CNMG • WNMG • CCMT types

### No Restriction for Holders

A standard holder can be used.  
(\*A double clamp, high rigidity tool is recommended.)

No restriction

The CNMG type can be used as a wiper at the 100° corner.

### Not Necessary to Adjust the Machining Programme

Conventional machining programmes can be used. (The CNMG • WNMG • CCMT types are based on the ISO/ANSI.)

Not necessary to adjust

## Special attention is necessary when using the DNMX • TNMX types due to the special top face geometry

### Restriction for Holders

Use a holder with a cutting edge angle (KAPR) of 93° for improving wiper efficiency. A holder with an end cutting angle of 91° can also improve wiper efficiency (see the following figure), however, there is no wiper efficiency with other cutting edge angles (60°, 90°, 107° etc.).

The hole geometry of the DNMX and TNMX type are the same as the DNMG and TNMG types. The "X" represents the special geometry of the corner point.

93° (Specified)

### Necessary to Adjust the Machining Programme

When machining errors occur, please adjust the programme.  
(The DNMX•TNMX types are not based on the ISO/ANSI. Please refer to the next page.)

Adjustment necessary

## ■ Adjustment of machining programmes for DNMX • TNMX types

### Basic Process) Adjusting Toward X-axis and Z-axis

Adjusting the differential between a standard insert and Z-axis / X-axis.

#### Adjustment toward X-axis

Corner radius 0.4, 0.8: **0.04 mm**  
Corner radius 1.2 : **0.05 mm**

#### Adjustment toward Z-axis

### A) Adjusting a Taper

\*Necessary to maintain a correct taper.

Adjust the relief angle toward the normal line.

Note 1) Adjust the angle toward the normal line in the case where the adjustment number is minus ( $\theta = 60^\circ - 70^\circ$ ) and is not machined completely.

### Classification

| Corner radius | Taper Angle $\theta^\circ$ |      |      |   |      |      |      |       |      |      |      |      |       |       |       |    |
|---------------|----------------------------|------|------|---|------|------|------|-------|------|------|------|------|-------|-------|-------|----|
|               | -25—-15                    | -10  | -5   | 0 | 5    | 10   | 15   | 20—35 | 40   | 45   | 50   | 55   | 60—65 | 70    | 75—85 | 90 |
| 1.2           | 0.04                       | 0.03 | 0.01 | 0 | 0.02 | 0.03 | 0.04 | 0.05  | 0.04 | 0.04 | 0.02 | 0.01 | -0.01 | 0     | 0.01  | 0  |
| 0.8           | 0.03                       | 0.02 | 0.01 | 0 | 0.01 | 0.02 | 0.03 | 0.04  | 0.03 | 0.03 | 0.02 | 0    | -0.01 | 0     | 0.01  | 0  |
| 0.4           | 0.02                       | 0.01 | 0.01 | 0 | 0.01 | 0.01 | 0.02 | 0.02  | 0.02 | 0.01 | 0.01 | 0    | -0.01 | -0.01 | 0     | 0  |

The number  $\rightarrow$  + numbers: adjustment of relief angle, - numbers: adjustment of drive-in angle (mm)

### B) Adjusting a Corner R

\*Necessary to maintain a correct corner radius.

Adjust the work diameter to the same as the taper to prevent over-cut.

**The value of adjustment to workpiece R = Workpiece R + the adjustment value**

\*No adjustment of the corner radius in this case.

Ex : In case of machining R 2.0 when using a corner R 1.2 type insert.

The corner radius of the insert      The adjustment amount on the workpiece radius.

Corner Radius 0.4  $\rightarrow$  Work Radius **+0.05(mm)**  
Corner Radius 0.8  $\rightarrow$  Work Radius **+0.11(mm)**  
Corner Radius 1.2  $\rightarrow$  Work Radius **+0.14(mm)**

**When correcting corner radius:**

It is not necessary to adjust the machining programme, however, machining errors can occur within max.  $\pm 0.03$  mm due to corrections by an approximate number.

### The Easy-to-correct Method

**Corner Radius Correction** Input the correction number of each corner radius.

**The value of corrected corner radius = approximation**

\*No need to adjust the programme in this case.

The corner radius of the insert      The value of corrected corner radius = approximation

Corner Radius 0.4  $\rightarrow$  **R0.36(mm)**  
Corner Radius 0.8  $\rightarrow$  **R0.76(mm)**  
Corner Radius 1.2  $\rightarrow$  **R1.16(mm)**

Ex : In the case of machining a corner with a radius R 2.0 when using an insert with a corner radius R 1.2.

Others : The value of correction is same for both DNMX and TNMX. Differentiate between them by the size of corner radius.

# TURNING APPLICATION RANGE

A

TURNING INSERTS

## TURNING APPLICATION RANGE

● Recommended insert grade based on cutting speed and conditions for each material.

TURNING INSERTS

A

## CUTTING CONDITIONS

Stable Cutting

Continuous Cutting  
Constant Depth of Cut  
Pre-Machined  
Securely Clamped Component Cutting

General Cutting

Unstable Cutting

Heavy Interrupted Cutting  
Irregular Depth of Cut  
Low Clamping Rigidity Cutting

A

TURNING INSERTS

# COATED CARBIDE (CVD)

- Special tough fibrous structure improves wear and fracture resistance.
- Covers a wide application range and thus reduces the number of tools required.

**Dramatic increase in stability and wear resistance, enabled by utilising the improved coating adhesion and crystal orientation technology.**

## MC6115

### Super Nano Texture Technology

The standard Nano Texture Technology has been improved and developed to be an industry leading standard for crystal growth of Al<sub>2</sub>O<sub>3</sub> coatings. This Super Nano Texture Technology increases tool life and wear resistance due to the fine, dense crystal growth process.

### Super TOUGH-Grip

The Super TOUGH-Grip layer has finer crystal grains that enhance the strength of the adhesion between the coating layers.

## ■ GRADE CHARACTERISTICS

| Material |                                | Grade      | Substrate      | Coating Layer                       |           |
|----------|--------------------------------|------------|----------------|-------------------------------------|-----------|

Note 1) Hardness shows representative value of the substrate.

### Strengthened chipping resistance

Cracks that occur during unstable machining are prevented due to the relaxing of the tensile stress in the coating. MC6100 series has an 80% reduction in coating tensile stress compared to conventional CVD inserts.

## MC6125

### Impact Stress During Machining

Cracks are generated in the surface of coatings during machining. They propagate through the coating into the substrate due to the large tensile stress in the coating structure. This creates one of the main causes of sudden insert breakage.

### Impact Stress During Machining

MC6100 series has a much lower level of stress than conventional CVD coatings due to the surface treatment. This divides the force of impacts during machining and protects from sudden fracturing.

Relaxing of the Tensile Stress

# COATED CARBIDE (PVD)

- PVD coating prolongs tool life under the same cutting conditions compared to uncoated carbide.
- Coating of tools with sharp edges is possible without softening or changing the quality of the substrate.

## SELECTION STANDARD

### TURNING

| Material               | Recommended Grade | Recommended Cutting Speed (m/min) | ISO | Application Range |
|------------------------|-------------------|-----------------------------------|-----|-------------------|

## FEATURES OF VP (MIRACLE) COATING

Compared to conventional coating technology, VP (MIRACLE) coating features (Al,Ti)N coating with an increased heat resistance and adhesion strength.

## APPLICATION EXAMPLES

| Insert (Grade)     |                       | DCMT11T304-MV(VP15TF)                                                                                                                                                                                  | CNMG120408-MJ(VP10RT)                                                                                                                           |

# CERMET

- The optimized alloy structure and special alloy binder improves both wear and fracture resistance.
- It covers a wide application range and reduces the number of tools required.
- NX3035 for wet cutting.
- NX2525 for dry cutting.

## ■ GRADE CHARACTERISTICS

| Grade  | Hardness (HRA) |
|--------|----------------|
| NX2525 | 92.2           |
| NX3035 | 91.5           |

Note 1) Hardness shows representative value of the substrate.

# COATED CERMET

- Coated cermet (PVD coating) has superior wear and fracture resistance, and therefore provides a stable cutting performance.

A

TURNING INSERTS

Effective for production of small parts.

## MP3025

MP3025 provides improved adhesion of the coating layer due to the newly-developed special substrate. Uniform flank wear allows prolonged machining and maintains excellent surface finishes.

Ti-compound PVD coating provides excellent wear and welding resistance.

Substrate surface provides excellent adhesion strength for coating layer.

Substrate with superior fracture resistance and thermal shock resistance.

# CEMENTED CARBIDE

- UTi grades are available for steel and cast iron. HTi grades are available for non-ferrous and non-metal materials and are also suitable for cast iron.

This image shows a blank sheet of white paper designed as a memo template. At the top left, the word "Memo" is printed in a bold, black, sans-serif font. A thick horizontal line runs across the page just below the title. The rest of the page is filled with horizontal dashed lines, providing space for writing. The paper has a clean, minimalist aesthetic.

# CLASSIFICATION OF PCBN & PCD GRADES

## FEATURES

### NON-COATED PCBN MATERIALS

PCBN sintered material base cutting tools are produced by binding CBN (cubic Boron Nitride) and ceramic having hardness next to diamond and sintering them under ultra-high pressure and at high temperature.

PCBN has lower affinity to iron than diamond. The low affinity and high hardness properties means that sintered PCBN delivers a superior cutting performance especially during high speed machining of materials such hardened steel, cast iron and sintered alloys.

B

### COATED PCBN MATERIALS

To achieve longer tool life, MITSUBISHI MATERIALS uses a unique "Particle-activated Sintering Method", combined with increased cutting edge strength. With high crater wear resistance PCBN grades, plus a wear resistant ceramic coating, longer tool life and improved machine efficiency are obtained.

### PCD MATERIALS (Sintered Diamond)

Suitable for cutting materials such as nonferrous metals and fibre reinforced plastics (FRP) including aluminium alloys. It supports ultra high speed finish machining.

## Materials for turning grades/application area

### ● Hardened Steel

### COATED PCBN MATERIALS

Suitable for finishing with surface roughness  $R_a$  0.6  $\mu\text{m}$  or  $R_z$  2.4  $\mu\text{m}$  or less.

### NON-COATED PCBN MATERIALS

Coated PCBN Grade BC8100/BC8200 and non-coated PCBN Grade MB8100 for high-hardness steel processing are available for a wide range of applications from finishing to continuous cutting of hardened steels and strongly interrupted machining.

## ● Sintered Alloy

The PCBN grade "MB4120" for cutting sintered alloys and cast iron can be used over a wide range of applications from continuous to interrupted machining of cast iron and sintered alloy components such as oil pumps and valve mechanisms.

## ● Cast Iron

### BC5110

Tough substrate with a high hardness coating provides excellent chipping and wear resistance.

Range of grades available for general to larger depths of cut to enable high efficiency machining.

## ● Aluminium Alloy

\* MD205, MD230 : Non-Standard

Suitable for cutting materials such as nonferrous metals and fiber reinforced plastics (FRP) including aluminium alloys. It supports ultra high speed finish cutting.

# COATED PCBN SERIES

## BC8200 series for machining of hardened steel

### FEATURES

#### ■ A Newly Developed Special Ceramic PVD Coating

##### BC8210

##### BC8220

#### ■ Ultra Micro-Particle Binder Prevents Sudden Fractures

##### ● Conventional

##### ● BC8100 Series BC8200 Series

The ultra micro-particle binder prevents linear crack development to avoid sudden fracturing.

#### ■ Ultra Micro-Particle and Heat Resistant Binder Technology

### Positive Effect of the Newly Developed Heat Resistant Binder

The progress of crater wear is greatly reduced due to the use of a heat resistant binder. This suppresses chipping, crater wear and fracturing.

# Cast Iron Machining **BC5110**

## FEATURES

BC5110 uses a tough substrate with a highly hard coating to provide excellent chipping and wear resistance.

### Excellent Chipping Resistance

Compared to conventional grades, the fine grain and high CBN content greatly improves chipping resistance and provides stability and long tool life.

### Excellent Wear Resistance Coating

The hard ceramic coating layer provides excellent surface finishes as well as wear and notch resistance during continuous cutting. Additionally, chipping and peeling of the coating layer is suppressed due to the improved bonding strength to the CBN substrate.

# FOR CYLINDER LINER **MB5015**

\*Produced to order only.

## FEATURES

**MB5015** is an exclusive grade with high wear resistance for boring of centrifugal casting cylinder liners in semi finishing or finishing applications.

### ■ Recommended Cutting Conditions

### ■ Cutting Performance

B

# PCBN

- Suitable for high speed finishing of heat treated steel, sintered ferrous alloy and cast iron.
- Low affinity to iron, thus good surface finishes are possible.
- Grinding operations can be replaced by machining.

## ● Heat Treated Steel

## PETIT CUT INSERT SERIES

The surface area of the CBN sintered body has been optimised to allow for a lower price. In addition, tool management is easier because repolishing is not required.

# PCBN CHIPBREAKER INSERT

## ■ Application Area

A BR Chipbreaker has been added to achieve better chip control at higher depths of cut.  
A versatile range of chipbreakers is available for a wide range of applications.

**BR Chipbreaker**

**BM Chipbreaker**

**BF Chipbreaker**

## **NEW** BR Chipbreaker (BC8220)

The number of passes needed is reduced and chip control during high depths of cut is also improved.  
Chips are formed with the effect from the rake angle, and the multi stage breaker wall supports a wide range of cuts.

Recommended Cutting Conditions :  $V_c=80-200$  m/min,  $f \leq 0.3$  mm/rev,  $a_p=0.6-1.0$  mm

**Achieves ideal chip control even at high depths of cut.**

### <Cutting Conditions>

Material : JIS SCr420 (60 HRC)  
 Inserts : BR-CNGM120408TA2  
 Cutting Speed :  $V_c=200$  m/min  
 Feed per Rev. :  $f=0.1$  mm/rev  
                     0.3 mm/rev  
 Depth of Cut :  $a_p=0.6$  mm  
                     1.0 mm  
 Cutting Mode : Wet Cutting

# BM Chipbreaker (BC8220)

Great chip control when machining at medium depths of cut. (0.3—0.8 mm)

Recommended Cutting Conditions :  $V_c=80-200$  m/min,  $f \leq 0.3$  mm/rev,  $a_p=0.3-0.8$  mm

B

<Cutting Conditions>  
Material : JIS SCM415 (60 HRC)  
Inserts : BM-CNGM120408TA2  
Cutting Speed :  $V_c=160$  m/min  
Feed per Rev. :  $f=0.1$  mm/rev  
                  0.3 mm/rev  
Depth of Cut :  $a_p=0.4$  mm  
                  0.8 mm  
Cutting Mode : Wet Cutting

# BF Chipbreaker (BC8210, BC8220)

Achieves excellent chip control while finish cutting at depths of 0.3 mm or less.

Recommended Cutting Conditions :  $V_c=80-200$  m/min,  $f \leq 0.3$  mm/rev,  $a_p=0.1-0.3$  mm

<Cutting Conditions>  
Material : JIS SCM415 (60 HRC)  
Inserts : BF-CNGM120408TS2  
Cutting Mode : Wet Cutting

# WIPER INSERT

## FEATURES

### Improving Surface Finish

Under the same machining conditions as conventional chipbreakers, but with the feed rate increased, the surface finish of the material can be improved.

### Improving Efficiency

High feed rates not only shorten machining times but also make it possible to combine roughing and finishing operations.

### Increased Tool Life

When using high feed conditions, the time required to cut one component is decreased, thus more parts can be machined with each insert. In addition, the high feed rate prevents rubbing, therefore, delaying the progression of wear and increasing tool life of the insert.

### Improving Chip Control

Under high feed conditions, the chips generated become thicker and are more easily broken, thus, chip control is improved.

## Application of Wiper Inserts

The most recommended wiper shape is the WS Wiper. If deflection or chatter occur, use the WL Wiper.

### Examples of Low Rigidity:

- When overhang length is long due to boring
- When the material has a small diameter

## Cutting Performance

### WL Wiper (External Turning)

### WL Wiper (Boring)

## Combination of BF Chipbreaker and WS Wiper Insert

CNGM and DNGM types are now available with new inserts that combine a BF Chipbreaker with a WS wiper Insert. (BC8210 : BF-○NGM○○○○○○○TSWS2, BC8220 : BF-○NGM○○○○○○○TAWS2)

It is effective for chip control and improvement of finished surface roughness without worrying about the hand of the tool even when continuous external or internal turning and facing.

**BF Chipbreaker**

**WL Wiper (No hand)**  
BF-CNGM120408TSWS2

**BF Chipbreaker**

**WL Wiper (No hand)**  
BF-DNGM150412TAWS2

## ■ Notes for Use

### When using CNGM type

#### No Restriction for Holders

A standard holder can be used.  
(A double clamp, high rigidity tool is recommended.)

### When using DNGM type

#### Restriction for Holders

Use PDJN holder or DDJN holder with an end cutting angle 93° for improving wiper efficiency. There is no wiper efficiency with other end cutting angles (60°, 90°, 107°etc.).

Displays great wiper efficiency when machining the end face and outer diameter in both right-hand and left-hand machining.

The DNGM type is not suitable for machining the R that connects the end face and the outer diameter because it will leave uncut parts.

# PCBN GROOVING SERIES (GY)

**BC8110 coated materials for continuous machining of hardened steel have been added to GY inserts.**

GY is a grooving tool series that achieves high rigidity with the "Tri-Lock System".  
(See page F004 for more details.)

BC8110 materials with excellent wear resistance have been added. Compared to conventional materials, they display excellent wear resistance to achieve long tool life. A blade width of 6 mm has also been added to the lineup of BC8110.

B

## Recommended Cutting Conditions

| Material                | Hardness | Grade         | Cutting Speed Vc (m/min) | Cutting Mode |
|-------------------------|----------|---------------|--------------------------|--------------|
| <b>H</b> Hardened Steel | 35—65HRC | <b>BC8110</b> | 100<br>(60—120)          | Dry, Wet     |

## Cutting Performance

Tool life evaluation for the GY holder

<Cutting Conditions>

Insert : GY1G0200D020N-GFGS  
Material : JIS SG420 (60HRC)  
Cutting Speed : Vc=120 m/min  
Feed : f=0.1 mm/rev  
Depth of Cut : ap=0.3 mm  
Cutting Mode : Dry Cutting

## Application Example

|                    |                                                                                                                                              |     |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Insert             | GY1G0300F020N-GFGS (Grade : BC8110)                                                                                                          |     |
| Material           | <br>Alloy steel (58—62HRC)                                |     |
| Component          | Input shaft                                                                                                                                  |     |
| Cutting Conditions | Cutting Speed Vc (m/min)                                                                                                                     | 130 |
|                    | Feed f (mm/rev)                                                                                                                              | 0.1 |
| Result             | <br>Tool life over twice as long as conventional products |     |

# PCD (SINTERED DIAMOND)

- Suitable for materials such as aluminium alloy, non-ferrous metals and fibre strengthened plastic.
- Suitable for extremely high speed finishing.

## FEATURES

| Grade         | Features                                                                                                                                                                                                                                           |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MD205*</b> | <b>For Continuous Cutting</b><br>Coarse grain diamond particles are sintered and wear resistance is excellent. Use when wear resistance with MD220 is insufficient.                                                                                |
| <b>MD220</b>  | <b>Materials for general machining</b><br>Sintered medium grain diamond particles. Wear resistance and fracture resistance are superbly balanced. Applicable to general finishing of non-ferrous metals, non-metal cutting, and similar machining. |
| <b>MD230*</b> | <b>For Interrupted Cutting</b><br>Fine grain diamond particles are used. Fracture resistance and cutting edge sharpness are excellent. Use when fracture resistance and a high quality finished surface is demanded with MD220.                    |
| <b>MD2030</b> | <b>For Heavy Interrupted Cutting</b><br>Strong sintering of ultra micro-grain PCD particles provides exceptional fracture resistance. Chipping during high-speed finish milling can be controlled.                                                 |

\* MD205, MD230 : Non-Standard

Note 1) ◎ : 1st recommendation. ○ : 2nd recommendation  
Note 2) Not suitable for steel.

## PETIT CUT INSERT SERIES

- **Economical** The small PCD tip delivers long tool life.  
Eliminates the need for regrinding, making tool management easier and economical.
- **With Chipbreaker** Chipbreaker formed directly on the PCD portion delivers superior chip control.
- Corner R0.05 mm inserts are available, making it suitable for the machining of small work corner radii.
